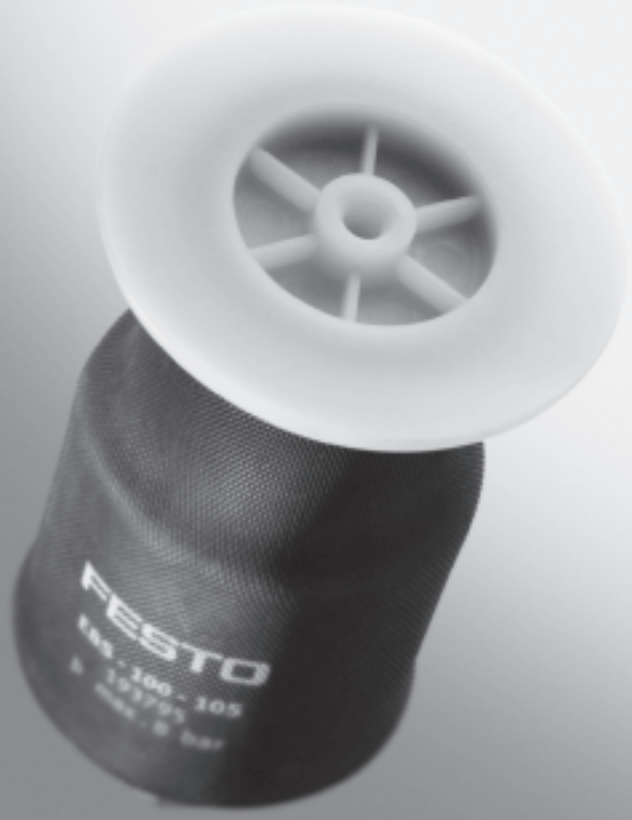
Bellows cylinders EB/EBS

FESTO



- Suitable for use under harsh, dusty environmental conditions
- Can be used under water
- Sturdy design
- Forces range from 2 ... 50 KN
- Low installation height
- No stick-slip effect
- Maintenance-free

Bellows cylinders EB/EBS

Key features, product range overview and type code

FESTO

Key features

Bellows cylinders function both as driving and pneumatic spring components. Bellows cylinders function as a driving component by providing pressurising and exhaust functions. As the stroke increases, the force generated is reduced in relation the contractional force of the bellows. When bellows cylinders are supplied with permanent pressure, they function as a cushioning component. The simple design consists of two metal plates with a ribbed rubber bellows. There are no sealing components and no moving mechanical parts. Bellows cylinders are single-acting drives that do not require spring returns, as the reset is performed through the application of external force. Rolling bellows have a different stroke/force characteristic to conventional bellows and can cover a wider stroke range in relation to installation height.
With rolling bellows cylinders, the reduction in force only begins due to the contractional force of the bellows after approximately 50% of the stroke travelled.

Product range overview

Function	Variant	Type	Size	Stroke [mm]	➔ Page
Single-acting	**Bellows**				
		**EB** Single-bellows cylinder	145	60	1 / 5.1-3
			165	65	
			215	80	
			250	85	
			325	95	
			385	115	
		**EB** Double-bellows cylinder	145	100	1 / 5.1-3
			165	125	
			215	155	
			250	185	
			325	215	
			385	230	
	Rolling bellows				
		**EBS** Rolling bellows	80	110	1 / 5.1-12
			100	105

General technical data						
Size	145	165	215	250	325	385
Pneumatic connection	G1⁄8	G1⁄4	G3⁄4	G3⁄4	G1⁄4	G1⁄4
Mode of operation	Single-acting					
Design	Bellows					
Type of mounting	With female thread					
Mounting position	Any					

Operating and environmental conditions		
Operating medium		Filtered compressed air, lubricated or unlubricated
Operating pressure	[bar]	0 ... 8
Ambient temperature	[°C]	–40 ... +70
Corrosion resistance class CRC[1)]		2

1) Corrosion resistance class 2 to Festo standard 940 070
Components subject to moderate corrosion stress. Externally visible parts with primarily decorative surface requirements which are in direct contact with a normal industrial environment or media such as coolants or lubricating agents

Forces [N]						
Size	145	165	215	250	325	385
Single-bellows cylinder						
Force/stroke curve	→ 1 / 5.1-4		→ 1 / 5.1-5			
Resetting force	200				300	
Double-bellows cylinder						
Force/stroke curve	→ 1 / 5.1-6		→ 1 / 5.1-7			
Resetting force	200				300	

- Note

- Bellows cylinders may only be driven against a workpiece, or they must be equipped with stroke limiting stops at the stroke ends, because the bellows would otherwise be overloaded
- A resetting force is required in order to press the bellows cylinder together to its minimum height. As a rule, this is achieved through the applied load
- The entire bearing surfaces of the upper and lower plates must be utilised in order to absorb forces
- Bellows cylinders must be exhausted before disassembly
- The rubber bellows must not come into contact with other parts during operation

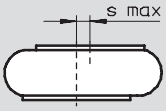
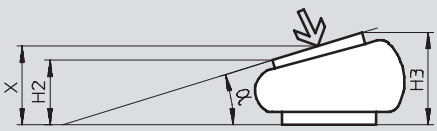
1 Mounting thread
2 Compressed air connection
3 Required fitting space
4 Status upon delivery
5 Minimum installation height
6 Maximum extended end position

Maximum offset between the mounting surfaces





Note

The stroke of the bellows cylinder can be made to describe a circular arc, in which case the indicated tilt angle α must not be exceeded. During setup it must be observed that the minimum height H2 is not fallen short of, and that the maximum height H3 is not exceeded at any given point. The height at the centre of the plate X is the decisive factor in the calculation of the thrust.

Function

- Ø - Diameter
  80 and 100 mm
- I - Stroke length
  105 and 110 mm

General technical data		
Size	80	100
Pneumatic connection	G3/8	
Mode of operation	Single-acting	
Design	Rolling bellows	
Type of mounting	With female thread	
Mounting position	Any	

Operating and environmental conditions		
Operating medium		Filtered compressed air, lubricated or unlubricated
Operating pressure	[bar]	0.9 ... 8.0
Ambient temperature	[°C]	–40 ... +70
Corrosion resistance class CRC[1)]		2

1) Corrosion resistance class 2 to Festo standard 940 070
Components subject to moderate corrosion stress. Externally visible parts with primarily decorative surface requirements which are in direct contact with a normal industrial environment or media such as coolants or lubricating agents

Forces [N]		
Size	80	100
Force/stroke curve	→ 1 / 5.1-13	
Resetting force	350	450

- Note

- Bellows cylinders may only be driven against a workpiece, or they must be equipped with stroke limiting stops at the stroke ends, because the bellows would otherwise be overloaded
- A resetting force is required in order to press the bellows cylinder together to its minimum height. As a rule, this is achieved through the applied load
- Rolling bellows require a minimum pressure of 0.9 bar in order to be able to roll on the piston. Consequently they must not be pushed back to their initial position when in the unpressurised state as this will damage the tube
- The entire bearing surfaces of the upper and lower plates must be utilised in order to absorb forces
- The rubber bellows must not come into contact with other parts during operation
- Bellows cylinders must be exhausted before disassembly
