

Swivel/gripper units HGDS

Swivel/gripper units HGDS

Key features

At a glance

Combination of parallel gripper and swivel module

The power transmission from the linear motion to the gripper motion takes place via the piston rod, which opens and closes the gripper jaws housed in the gripper housing via 2 reversing levers.

The swivel motion takes place via a swivel drive. It can be adjusted almost infinitely via 2 stops (max. 210°). The rotary motion is cushioned either via a flexible cushioning buffer or a hydraulic shock absorber. The swivel angle can be finely adjusted by means of a precision adjustment facility.

- 1 Flexible cushioning or hydraulic shock absorbers
- 2 Slot for proximity sensor SME/SMT-10 for sensing the swivel position
- 3 Gripper compressed air connection, closing
- 4 Slot for proximity sensor SME/SMT-10 for sensing the gripper position
- 5 Gripper compressed air connection, opening
- 6 Gripper jaw
- 7 Adjustable stop plates for the swivel motion, with magnet
- 8 Precise end stop with flexible cushioning or integrated shock absorber
- 9 Rotary vane
- 10 Piston rod for gripping motion
- 11 Piston with magnet

Mounting options

Direct mounting

Dovetail connection

Note
Swivel/gripper units are not suitable for the following or similar applications:

- Machining
- Aggressive media

- Grinding dust

- Welding spatter

HGDS-PP-20-YSRT-A

Dependency between operating pressure and swivel time

When the operating pressure of the gripper drive is reduced, the permissible swivel time at the same mass moment of inertia must be increased by 15% per bar of operating pressure.

Example:

Given:

$$J = 40 \text{ kgm}^2 \times 10^{-4}$$

Operating pressure 4 bar (gripper drive)

Swivel time at 6 bar = 0.4 s, see graph opposite

This yields a swivel time at 4 bar:

$$t = 0.4 + 2 \times 15\% = 0.52 \text{ s}$$

Cushioning time of the shock absorber = 0.1 s

This yields a swivel time of

$$t_{\text{tot.}} = 0.52 \text{ s} + 0.1 \text{ s} = 0.62 \text{ s}$$

Swivel/gripper units HGDS

Technical data

Precision adjustment of the swivel angle

The swivel angle can be adjusted roughly by means of two stop plates → 2. The precision adjustment works as follows:

Variants P and YSRT differ in only one component. The retainer and the fine

adjustment are identical. In both variants, the rotary vane travels to a metallic stop, which can be adjusted with great accuracy via the adjustable sleeve for P cushioning or the shock absorber for YSRT cushioning.

- 1) Loosen the locking screw underneath the cushioning element

- 2) Adjust the cushioning element as required. Observe the minimum and maximum settings.

Size	12	16	20	
Precision adjustment range	P cushioning [°]	-6		
	YSRT cushioning [°]	-2.5		
Swivel angle adjuster per revolution	[°]	3.1	2.8	2.2

Closing	26	45	65
Total gripping force			
Opening	58	113	170
Closing	52	90	130

Gripping force F_{Grip} per gripper jaw as a function of operating pressure p

Gripping forces related to operating pressure and lever arm can be determined for the various sizes using the following graphs. The characteristic curves apply for external and internal gripping.

Note
The gripping force is practically independent of the lever arm. Fluctuation at max. lever arm and max. operating pressure approx. 10%.

for unthrottled operation:

HGDS-12 (max. lever arm x 40 mm)

HGDS-16 (max. lever arm x 50 mm)

HGDS-20 (max. lever arm x 70 mm)

- - - - - Closing

Swivel/gripper units HGDS

Technical data

Opening and closing times [ms] at 6 bar

With gripper jaws

With additional gripper fingers

The indicated opening and closing times [ms] have been measured at room temperature and at 6 bar operating pressure with horizontally mounted gripper without external

gripper fingers. The grippers must be throttled for greater applied loads. Opening and closing times must then be adjusted correspondingly.

with additional gripper fingers as a function of applied load

Size	12	16	20	
Max. applied load	0.3 N	0.5 N	1.0 N	
HGDS-...-A unthrottled	Opening	20	50	70
	Closing	30	50	100

with additional gripper fingers as a function of applied load

Size	12		16		20			
	1.0 N	2.0 N	1.0 N	2.0 N	1.0 N	2.0 N		
HGDS-...-A throttled	Closing		100	150	100	200	100	250

Eccentricity y as a function of lever arm x

The dependency on the lever arm and the maximum permissible off-centre point of force application can be determined for the various sizes using the following graphs.

It is vital that you adhere to the mass moment of inertia $\rightarrow 5$ when making your selection.

The gripping forces apply, see above.

Calculation example

Lever arm $x = 40$ mm

To be found: Eccentricity y

- Move along the horizontal axis to the point of intersection
- Then move vertically downwards until you intersect the scale
- Read the eccentricity

Max. eccentricity = 30 mm

Swivel/gripper units HGDS

Technical data

Eccentricity y as a function of lever arm x

for unthrottled operation:

HGDS-12 (max. lever arm 40 mm)

HGDS-16 (max. lever arm 50 mm)

HGDS-20 (max. lever arm 70 mm)

Characteristic load values per gripper jaw

The indicated permissible forces and torques refer to a single gripper jaw. The indicated values include the lever arm, additional applied loads caused by the workpiece or external gripper fingers, as well as forces which occur during movement.

The zero coordinate line (gripper finger guide) must be taken into consideration for the calculation of torques.

Size		12	16	20
Max. permissible force F_z	[N]	20	30	60

FESTO

If the swivel/gripper unit is mounted **on the front**, proximity sensors with the connecting cable **at right angles** should be used.

When proximity sensors with in-line connecting cables are used, the sensors project beyond the swivel/gripper unit after the switching point has been set.
