

# Valve terminals type 32 MPA

# Valve terminals type 32 MPA

Key features

FESTO

## Innovative

- Slim high-performance valves in sturdy metal housing
- MPA1 flow rates up to 360 l/min
- MPA2 flow rates up to 700 l/min
- From the individual valve to the valve terminal with multi-pin plug, AS-interface, CPI and fieldbus connections and control block
- Dream team: fieldbus valve terminal suitable for electrical peripherals CPX. This means:
  - Forward-looking internal communication system for actuation of the valves and CPX modules
  - Diagnostics down to the individual valve
  - Valves can be actuated with or without (standard) isolated electrical circuits

## Versatile

- Modular system offering a range of configuration options
- Expandable up to 128 solenoid coils
- Conversion and expansion possible at a later date
- Further manifold blocks can be assembled using just three screws and sturdy separating seals on metal separator plates
- Integration of innovative function modules possible
- Manual regulators, rotatable pressure gauges
- Proportional pressure regulators
- Additional air supply via additional pressure zones using supply plates
- Wide range of pressures –0.9 ... 10 bar
- Wide range of valve functions

## Reliable

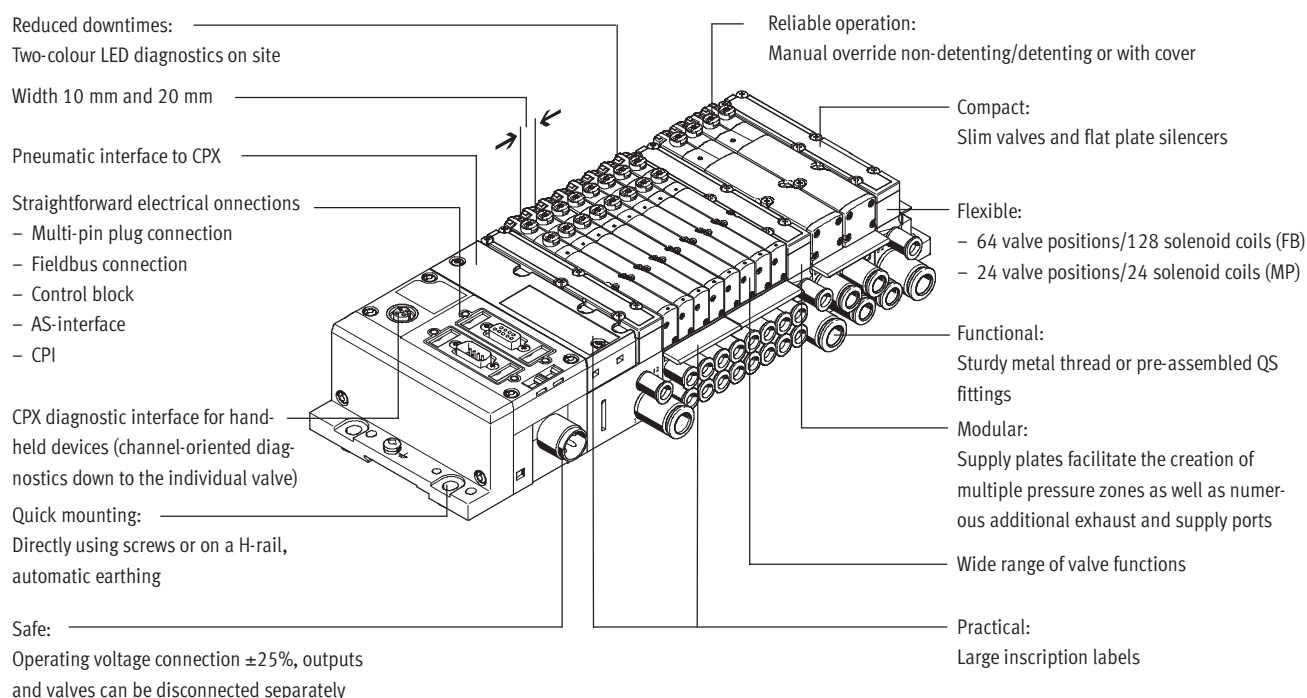

- Sturdy and durable metal components
  - Valves
  - Manifold blocks
  - Seals
- Fast troubleshooting thanks to LEDs on the valves and diagnostics via fieldbus
- Extensive operating voltage range  $\pm 25\%$
- Ease of servicing through replaceable valves and electronics modules
- Manual override either non-detenting, detenting or secured against unauthorised activation (covered)
- Durable, thanks to tried and tested piston spool valves
- Large and durable labelling system, suitable for barcodes

## Easy to mount

- Ready-to-install unit, already assembled and tested
- Lower selection, ordering, installation and commissioning costs
- Secure mounting on wall or H-rail mounting

### Electrical supply plate

- Increases the maximum number of valve positions possible to 64, with max. 128 solenoid coils
- Creation of isolated, individually disconnectable electrical circuits (voltage zones)
- Greater economy thanks to the higher number of valves/solenoid coils per valve terminal
- Greater safety through individual disconnection of valve groups, for example for EMERGENCY-STOP functions

 Note  
The electrical supply plate is available with either an M18 or 7/8" connection.

## Valve terminal configurator

Online via: → [www.festo.com](http://www.festo.com)

Selecting an MPA valve terminal using the online catalogue is quick and easy thanks to the convenient valve terminal configurator provided. This makes it much easier to find the right product.

The valve terminals are fully assembled according to your order specifications and are individually tested. This reduces the assembly and installation time to a minimum.

The valve terminal type 32 is ordered using the order code.

## 2D/3D CAD data

Online via: → [www.festo.com](http://www.festo.com)

You can request the CAD data for a valve terminal you have configured. To do so, perform the product search as described above. Go to the shopping basket and click on the CAD icon

(compass). On the next page you can generate a 3D preview or request another data format of your choice by e-mail.

# Valve terminals type 32 MPA

Key features

## Individual connection

Valves can also be used on individual sub-bases for actuators further away from the valve terminal.

The electrical connection is established using a standard 4-pin M8 plug (EN 60947-5-2).

## Multi-pin plug connection

The signal flow from the controller to the valve terminal takes place via a pre-assembled or self-assembled multi-wire cable to the multi-pin plug connection, which substantially reduces installation time.

The valve terminal can be equipped with max. 24 solenoid coils. This corresponds to 4 to 24 MPA1 or 2 to 24 MPA2 valves, or a combination of both.

Versions

- Sub-D connection
- Pre-assembled multi-pin cable
- Multi-pin cable for self-assembly

## AS-interface connection

A special feature of the AS-interface is its ability to simultaneously transmit data and supply power via a two-wire cable. The encoded cable profile prevents connection with incorrect polarity. The valve terminal with AS-interface is available in the following versions:

- With two to eight modular valve positions (max. 8 solenoid coils). This corresponds to 2 to 8 MPA1 or 2 to 8 MPA2 valves, or a combination of both.
- With all available valve functions.

The connection technology used for the inputs can be selected as with CPX: M8, M12, Harax, Sub-D, Cage Clamp® (terminals to IP20).

Further information

➔ Internet: as-interface

## CPI installation system

Valve terminal for CPI installation system:

Valve terminals with CP connection are intended for connection to higher-order fieldbus nodes or to control blocks. A fieldbus node or control block also enables the connection of decentralised input/output units. The following fieldbus protocols are supported:

- Festo fieldbus, ABB CS31, Moeller Suconet K
- Interbus
- Allen Bradley (1771 RIO)
- DeviceNet
- Profibus DP
- Profinet IO
- CC-Link
- Modbus/TCP
- Ethernet
- EtherCAT

Four strings with up to 32 inputs and outputs can be connected to a fieldbus node or control block. The connecting cables transmit the power supply for the input modules and the load voltage for the valves as well as control signals.

Further information

➔ Internet: ctec

# Valve terminals type 32 MPA

Key features

FESTO

## Fieldbus connection via the CPX system

An integrated fieldbus node manages communication with a higher-order PLC. This enables a space-saving pneumatic and electronic solution.

Valve terminals with fieldbus interfaces can be configured with up to 16 manifold blocks. In conjunction with MPA1 and 8 solenoid coils per manifold block, up to 128 solenoid coils can thus be actuated. An MPA2 with 4 solenoid coils per manifold block can actuate 64 solenoid coils.

### Versions

- Profibus DP
- ProfiNet
- Interbus
- DeviceNet connection
- CANopen
- CC-Link
- Ethernet/IP
- Front End Controller Remote
- Front End Controller Remote I/O
- Modbus/TCP

## Control block connection via the CPX system

Controllers integrated in the Festo valve terminals enable the construction of stand-alone control units to IP65, without control cabinets.

Using the slave operation mode, these valve terminals can be used for intelligent pre-processing and are therefore ideal modules for designing decentralised intelligence.

In the master operation mode, terminal groups can be designed with many options and functions which can autonomously control a medium-sized machine/system.

# Valve terminals type 32 MPA

Peripherals overview

## Modular pneumatic components

The modular design of the MPA facilitates maximum flexibility right from the planning stage and offers maximum ease of service in operation.

The system consists of manifold blocks and valves. The manifold blocks are screwed together and thus form the support system for the valves.

They contain the connection ducts for supplying compressed air to and venting from the valve terminal as well as the working lines for the pneumatic drives for each valve.

Each manifold block is connected to the next using three screws. Individual terminal sections can be isolated and further manifold blocks inserted by loosening these screws. This ensures that the valve terminal can be rapidly and reliably extended.

## Modular electrical peripherals

The manner in which the valves are actuated differs according to whether you are using a multi-pin terminal, fieldbus terminal or individual valve. The MPA with CPX interface is based on the internal bus system of the CPX and uses this serial communication system for all solenoid coils and a range of electrical input and output functions.

Serial linking facilitates the following:

- Transmission of switching information
- High valve density
- Compact design
- Position-based diagnostics

- Separate voltage supply for valves
- Flexible conversion without address shifting
- Transmission of status, parameter and diagnostic data  
→ Internet: cpx

- Option of CP interface
- CPX-FEC as stand-alone controller with access via Ethernet and web server

## Valve terminal with multi-pin plug connection

Order code:

- 32P-... for the pneumatic components
- 32E-... for the electrical components

MPA valve terminals with multi-pin plug connection can be expanded by up to 24 solenoid coils.

The multi-pin plug connection is designed as a removable 25-pin Sub-D connection to IP65.

The cable can be selected when ordering:

- 2.5 m
- 5 m
- 10 m

Each can be used for max. 8 or 24 valves.

# Valve terminals type 32 MPA

Key features – Pneumatic components

## Sub-base valve

MPA offers a comprehensive range of valve functions. All valves are equipped with piston spool and patented sealing system which facilitates efficient sealing, a broad pressure range and long service life. To increase power they have a pneumatic pilot control supplied by pilot air.

Sub-base valves can be quickly replaced since the tubing connectors remain on the manifold block. This design is also particularly flat.

Irrespective of the valve function there are sub-base valves with one solenoid coil (single solenoid) or with two solenoid coils (double solenoid or two single solenoid valves in one housing).

## Constructional design

### Valve replacement

The valves are attached to the metal manifold block using two screws, which means that they can be easily

replaced. The mechanical sturdiness of the manifold block guarantees excellent long-term sealing.

### Extension

Blanking plates can be replaced by valves at a later date. The dimensions, mounting points and existing pneumatic installations remain unchanged during this process.

The valve code (M, J, N, NS, K, KS, H, HS, B, G, E, X, W, D, DS I) is located on the front of the valve beneath the manual override.

- 1) If neither solenoid coil is energised, the valve moves to its mid-position by means of spring force.  
 If both coils are energised at the same time, the valve remains in the previously assumed switching position.

- - Note

A filter must be placed upstream of valves in vacuum mode. This prevents the ingress of foreign matter in the intake air into the valve (e.g. when operating a suction cup).

# Valve terminals type 32 MPA

Key features – Pneumatic components

## Vertical stacking

Additional function units can be added to each valve position between the sub-base and the valve.

These functions are known as vertical stacking, and enable special function-

ing or control of an individual valve position.

## Vertical stacking components

- 1 VMPA2 valve
- 2 Pressure regulator plate
- 3 Manifold block

## Vertical stacking

### Pressure regulator plate

An adjustable pressure regulator can be installed between the manifold block and the valve in order to control the force of the triggered actuator.

This pressure regulator maintains an essentially constant output pressure (secondary side) independent of pressure fluctuations (primary side) and air consumption.

Standard version:

- For supply pressure up to 6 bar or up to 10 bar
- Without pressure gauge (optional)
- Regulator head with 3 positions (locked, reference position, free running)

# Valve terminals type 32 MPA

Key features – Pneumatic components

## Vertical stacking

Mode of operation of the pressure regulator plate (P regulator) for port 1; code: PA, PF

This pressure regulator regulates the pressure upstream of the valve in duct 1. Ducts 2 and 4 thus have the same regulated pressure.

During venting, the exhaust flow in the valve is from duct 2 to duct 3 and from duct 4 to duct 5.

## Advantages

- The pressure regulator is not affected by venting, since the pressure is regulated upstream of the valve.
- The pressure regulator can always be adjusted, since the pressure from the valve terminal is always present.

## Application examples

- An equal working pressure is required at working ports 2 and 4.
- A lower working pressure (e.g. 3 bar) than the operating pressure present at the valve terminal (e.g. 8 bar) is required.

Mode of operation of the pressure regulator plate (B regulator) for port 2; code: PC, PH

This pressure regulator regulates the pressure in duct 2 after the pressure medium flows through the valve. During venting, the exhaust flow in the valve is from duct 2 to duct 3 via the pressure regulator.

## Restrictions

The pressure regulator can only be adjusted in switched state (e.g. the valve is switched to 2 and exhaust flow occurs from 4 to 5).

## Application example

The pressure regulator makes it possible to reduce the pressure at port 2 of an individual valve, in contrast to the operating pressure of the valve terminal.

# Valve terminals type 32 MPA

Key features – Pneumatic components

## Vertical stacking

Mode of operation of the pressure regulator plate (A regulator) for port 4; code: PB, PK

This pressure regulator regulates the pressure in duct 4 after the pressure medium flows through the valve.

During venting, the exhaust flow in the valve is from duct 4 to duct 5 via the pressure regulator.

## Restrictions

The pressure regulator can only be adjusted in switched state (e.g. the valve is switched to 4 and exhaust flow occurs from 2 to 3).

## Application example

If different working pressures are required at ports 4 and 2. The pressure present at port 2 is from duct 1.

Mode of operation of the pressure regulator plate (B regulator, reversible) for port 2, reversible; code: PL, PN

The reversible B regulator splits the supply air in duct 1 and regulates the pressure upstream of the valve in duct 3 (the unregulated pressure from duct 1 is in duct 5). The regulated air is then supplied to duct 2. The valve is thus operated in reversible mode.

During venting, the exhaust flow in the valve is from duct 2 to duct 1 and it is reversed into the manifold block via the intermediate plate to duct 3.

## Application examples

- When instead of the operating pressure of the valve terminal, a different pressure is required in duct 2.
- When fast exhaust venting is required.
- When the pressure regulator must always be adjustable.

Note

Reversible pressure regulator plates may only be combined with valves that can be operated in reversible mode.

## Advantages

- Fast cycle times.
- 50% higher exhaust flow rate, as air is not exhausted via the pressure regulator. The load on the pressure regulator is also reduced.
- No quick exhaust valves are required.
- Operating pressure is always present at the pressure regulator, as the pressure is regulated upstream of the valve, i.e. the regulator can always be adjusted.

## Restrictions

- 2x 3/2-way valves (code N, K, H) are not used, as pressure is present at ports 3 and 5.

# Valve terminals type 32 MPA

Key features – Pneumatic components

## Vertical stacking

Mode of operation of the pressure regulator plate (A regulator, reversible) for port 4, reversible; code: PK, PM

The reversible A regulator splits the working air in duct 1 and supplies the pressure upstream of the valve into duct 5 (the unregulated pressure from duct 1 is in duct 3). The regulated air is then supplied to duct 4. The valve is thus operated in reversible mode.

During venting, the exhaust flow in the valve is from duct 4 to duct 1 and it is reversed into the manifold block via the intermediate plate to duct 5.

## Application examples

- When instead of the operating pressure of the valve terminal, a different pressure is required in duct 4.
- When fast exhaust venting is required.
- When the pressure regulator must always be adjustable.

-  - Note

Reversible pressure regulator plates may only be combined with valves that can be operated in reversible mode.

## Advantages

- Fast cycle times.
- 50% higher exhaust flow rate, as air is not exhausted via the pressure regulator. The load on the pressure regulator is also reduced.
- No quick exhaust valves are required.
- Operating pressure is always present at the pressure regulator, as the pressure is regulated upstream of the valve, i.e. the regulator can always be adjusted.

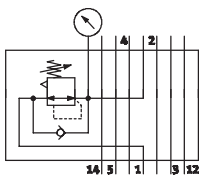

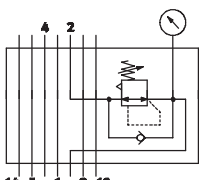

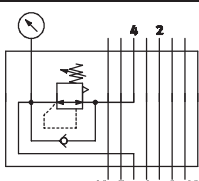

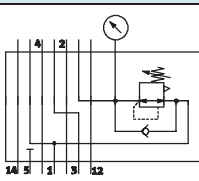

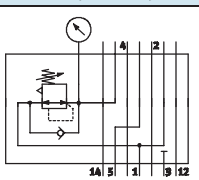

## Restrictions

- 2x 3/2-way valves (code N, K, H) are not used, as pressure is present at ports 3 and 5.

Key features – Pneumatic components

### Proportional pressure regulator

- 1 Green power LED
- 2 Red error LED

The purpose of the proportional pressure regulator VPPM-6TA-... is to regulate a pressure proportionally to a specified setpoint value. To this end, an integrated pressure sensor records the pressure at the working line and compares this value against the setpoint value. If there is a deviation between the nominal and actual values, the valve regulates the output

pressure until it reaches the setpoint value. The proportional pressure regulator has an additional supply connection to achieve the constant pressure supply required for high control quality.

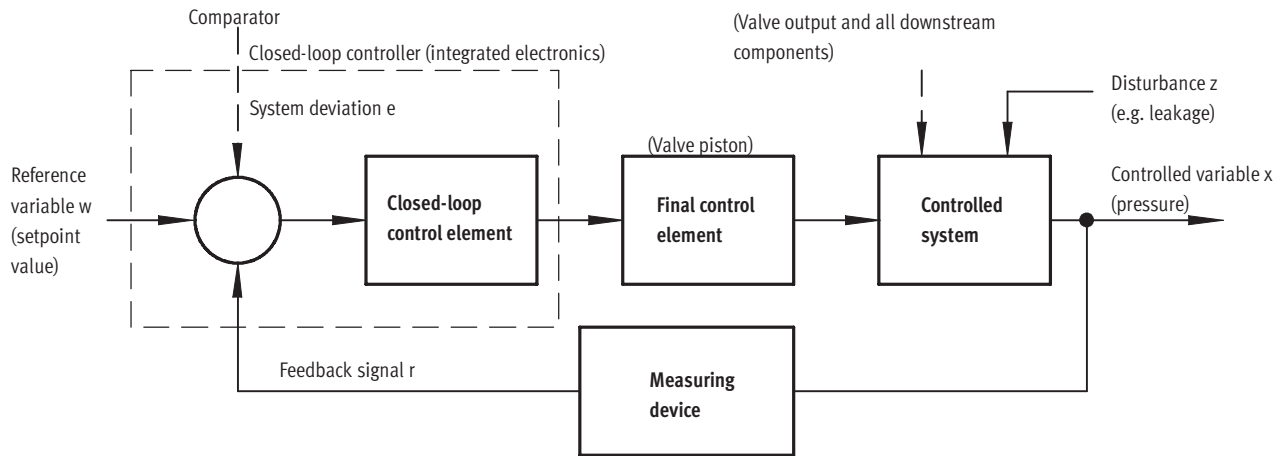

The proportional pressure regulator can be configured via the PLC or on-site via the handheld device (CPX-MMI) from Festo.

Proportional pressure regulator

## Valve terminals type 32 MPA

Key features – Pneumatic components

### Layout of a control circuit

#### Layout

The figure shows a closed-loop control circuit. The reference variable  $w$  initially acts on a comparator. The measuring device sends the value of the controlled variable  $x$  (actual value, e.g. 3 bar) to the comparator as a feedback signal  $r$ . The closed-loop control element detects the system deviation  $e$  and actuates the final control

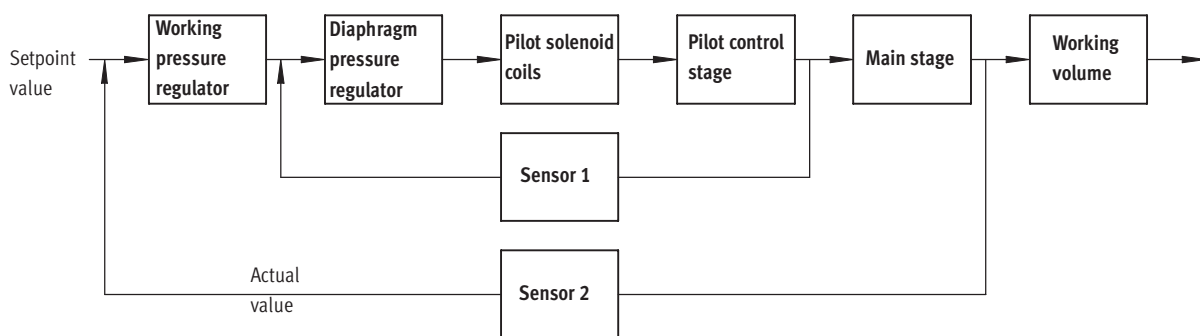

element. The output of the final control element acts on the controlled system. The closed-loop control element thus attempts to compensate for the difference between the reference variable  $w$  and the controlled variable  $x$  by using the final control element.

#### Method of operation

This process runs continuously so changes in the reference variable are always detected. However, a system deviation will also appear if the reference variable is constant but the controlled variable changes. This happens when the flow through the valve changes in response to a switching action, a cylinder movement or a change

in load. The disturbance variable  $z$  will also cause a system deviation. An example of this is when the pressure drops in the air supply. The disturbance variable  $z$  acts on the controlled variable  $x$  unintentionally. In all cases, the regulator attempts to readjust the controlled variable  $x$  to the reference variable  $w$ .

### Multi-sensor control (cascade control) of the VPPM

#### Cascade control

Unlike conventional direct-acting regulators, with multi-sensor control several control circuits are nested inside each other. The overall controlled

system is divided into smaller sub-controlled circuits that are easier to control for the specific task.

#### Control precision

Multi-sensor control significantly improves control precision and dynamic response in comparison with single-acting regulators.

## Valve terminals type 32 MPA

Key features – Pneumatic components

### Terms related to the proportional-pressure regulator

#### Hysteresis

There is always a linear relationship within a certain tolerance between the setpoint value entered and the pressure output. Nevertheless it makes a difference whether the setpoint value is entered as rising or falling. The difference between the maximum deviations is referred to as hysteresis.

#### Linearity error

A perfectly linear progression of the control characteristic of the output pressure is theoretical. The maximum percentage deviation from this theoretical control characteristic is referred to as the linearity error. The percentage value refers to the maximum output pressure (full scale).

#### Response sensitivity

The response sensitivity of the device determines how sensitively one can change, i.e. adjust, a pressure. The smallest setpoint value difference that results in a change in the output pressure is referred to as the response sensitivity. In this case, 0.01 bar.

#### Repetition accuracy (reproducibility)

The repetition accuracy is the margin within which the fluid output variables are scattered when the same electrical input signal coming from the same direction is repeatedly adjusted. The repetition accuracy is expressed as a percentage of the maximum fluid output signal.

#### Zero point suppression

In practice there exists the possibility of residual voltage or residual current at the setpoint input of the VPPM via the setpoint generator. Zero point suppression is used so that the valve is reliably vented at a setpoint value of zero.

# Valve terminals type 32 MPA

Key features – Pneumatic components

## Blanking plate

Plate without valve function for reserving valve positions on a valve terminal.

Valves and blanking plates are attached to the manifold block using two screws.

## Valve function

Code	Circuit symbol	Size		Description
		1	2	
L	—	■	■	For valve terminal only: Blanking plate for vacant valve position

## Compressed air supply and venting

### Pneumatic interface

The valve terminal MPA can be supplied with air at one or more points. This ensures that the valve terminal will always have a sufficient supply of air and that this air will be vented, even with large-scale expansions.

The main supply to the valve terminal is located on the pneumatic interface, which links the electrical and the pneumatic parts. Additional provision is made for a number of supply plates. Venting is either via integrated flat plate silencers or common lines for ducted exhaust.

These vents are located on the pneumatic interface as well as on the supply plates. In the case of ducted exhaust, at least one additional supply plate is required that then contains the exhaust port for the pilot air supply (port 82/84).

### Supply plate

## Pilot air supply

The port for the main pneumatic supply is located on the pneumatic interface.

The ports differ for the following types of pilot air supply:

- Internal
- External

### Internal pilot air supply

Internal pilot air supply can be selected if the required working pressure is between 3 and 8 bar. The pilot air supply is then branched from the compressed air supply 1 in the pneumatic interface using an internal connection. Port 12/14 is sealed with a blanking plug.

### External pilot air supply

If the supply pressure is less than 3 bar or greater than 8 bar, you must operate your MPA valve terminal with external pilot air supply. In this case the pilot air is additionally supplied via port 12/14 on the pneumatic interface.

### Note

If a gradual pressure build-up in the system using a soft-start valve is chosen, an external pilot air supply should be connected so that the control pressure applied during switch-on is already very high.

# Valve terminals type 32 MPA

Key features – Pneumatic components

## Supply plate

Additional supply plates can be used for larger terminals or to create additional pressure zones.

If several valves are to be operated simultaneously at full flow rate, it is recommended that a supply plate be positioned after every 8 valves (MPA1), or 4 valves (MPA2).

Supply plates can be configured at any point upstream or downstream of sub-bases. This applies to the following interfaces:

- MPA with CPX
- MPA with multi-pin plug connection
- MPA with AS-interface connection
- MPA with CPI connection

### MPA with ducted exhaust air

At least one supply plate via which the exhaust port 82/84 is vented is required with ducted exhaust air.

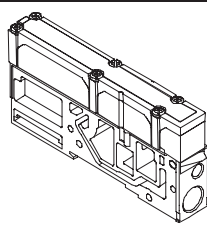

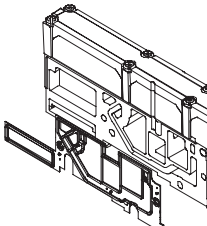

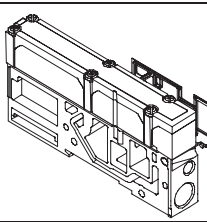

Supply plates contain the following ports:

- Compressed air supply (1)
- Venting of the pilot air supply (82/84) and pressure compensation
- Exhaust air (3/5)

Depending on your order, the exhaust ducts are either ducted or vented via the flat plate silencer.

The supply plate is configured using the code letter U if no directly adjoining separating seal is required.

If a separating seal (S, T or R) is selected to the direct right or left of the supply plate, then the code letter V or W identifies the position of the left-hand or right-hand separating seal. The code for the separating seal (S, T or R) is placed in front of the code for the supply plate (V or W).

Supply plate					
Code <sup>1)</sup>	Graphical symbol	Type	Size		Notes

W		VMPA1-...-SP...	■	■	Supply plate with separating seal on right, if R, S or T selected

1) The supply plate is equipped with silencer or exhaust plate depending on the code for the air supply S, T, V, X.

# Valve terminals type 32 MPA

Key features – Electrical components

## Electrical supply plate

Additional electrical supply plates can be used for larger terminals. This enables up to 64 valve positions/128 solenoid coils to be supplied.

### MPA with CPX

Electrical supply plates can be configured at any point upstream or downstream of sub-bases. An electrical supply plate is required after 8 valve sub-bases.

### MPA with CPI connection

Electrical supply plates can be configured at any point upstream or downstream of manifold blocks. An electrical supply plate is required after 8 valve sub-bases.

Note

Please note that only electrical modules with isolated electrical circuits are permissible to the right of the electrical supply plate. The electrical supply plate must not be installed directly to the left of a pneumatic supply plate (type VMPA1-FB-SP...).

Note

Max. 24 of 32 MPA1 coils or 12 of 16 MPA2 coils can be switched on at the same time in the case of an MPA with CPI connection.

## Creation of pressure zones and separation of exhaust air

If different work pressures are required, MPA offers various possibilities for building up pressure zones. Depending on the electrical interface up to 16 pressure zones are possible. A pressure zone is created by isolating the internal supply ducts between the manifold blocks using an appropriate separating seal or using a separator that is permanently integrated in the manifold block (code I or code III).

Compressed air is supplied and vented via a supply plate. The position of the supply plates and separating seals can be freely selected with the valve terminal MPA.

Separating seals are integrated ex-works as per your order. Separating seals can be distinguished through their coding, even when the valve terminal is assembled.

Note

The following must be taken into consideration for subsequent expansion or conversions:

Different separating seals are required for operating with ducted exhaust air and operation with flat plate silencers.

Key features – Pneumatic components

## Manifold block

MPA is based on a modular system consisting of manifold blocks and valves. The manifold blocks are screwed together and thus form the support system for the valves. They contain the connection ducts for

supplying compressed air to and venting from the valve terminal as well as the working lines for the pneumatic drives for each valve. Each manifold block is connected to the next using three screws.

Individual terminal sections can be isolated and further manifold blocks inserted by loosening these screws. This ensures that the valve terminal can be rapidly and reliably extended.

## Pressure sensor

- 1 Red LED: Pressure exceeded
- 2 Green LED: Pressure adhered to
- 3 Red LED: Pressure fallen below
- 4 Red LED: Common error display

The pressure sensor indicates whether the applied pressure exceeds, adheres to or falls below the setpoint value using three LEDs. An additional LED indicates common errors (limit exceeded or fallen below).

The limits for pressure monitoring are set by means of parameter settings. You can parameterise the pressure sensor plate via the PLC or the handheld device (CPXMMI) from Festo.

Alternatively the pressure in the exhaust duct (3/5) and the process pressure (external) can be measured. Pressure measurement in the exhaust duct is used for monitoring the operating pressure during reversible operation (supply to (3/5)).

# Valve terminals type 32 MPA

Key features – Assembly

## Valve terminal assembly

Sturdy terminal assembly thanks to:

- Four through-holes for wall mounting
- Additional mounting brackets
- H-rail mounting

Note

When wall-mounting MPA valve terminals with more than 4 manifold blocks, use additional mounting brackets of the type VMPA-BG-RW to

prevent damage to the valve terminal. The mounting brackets can be mounted on the pneumatic supply plates.

## Wall mounting – Multi-pin plug connection, AS-interface and CPI connection

The MPA valve terminal is screwed onto the mounting surface using four M4 or M6 screws. The mounting holes are on the pneumatic interface

and on the right-hand end plate. There are also optional mounting brackets available.

## Wall mounting – Fieldbus connection

The MPA valve terminal is screwed onto the mounting surface using six M4 or M6 screws. The mounting holes are on the left-hand end plate (CPX) and on the right-hand end plate (MPA).

The pneumatic interface also provides further mounting holes as well as optional mounting brackets.

## H-rail mounting

The MPA valve terminal is attached to the H-rail (see arrow A). The terminal is then swivelled around the H-rail and secured in place with the clamping component (see arrow B).

For H-rail mounting of the valve terminal you will need the following MPA mounting kit:

- With multi-pin plug: CPA-BG-NRH
- With fieldbus: CPX-CPA-BG-NRH

This enables mounting of the valve terminal on a H-rail to EN 60715.

## Individual valve assembly

- 1 Horizontal mounting holes
- 2 Vertical mounting holes

The individual sub-base is designed for wall mounting or for integration into a system or machine. It can be mounted horizontally or vertically.

# Valve terminals type 32 MPA

Key features – Display and operation

## Display and operation

Each solenoid coil is allocated an LED that indicates its signal status.

- Indicator 12 shows the switching status of the coil for output 2
- Indicator 14 shows the switching status of the coil for output 4

### Manual override

The manual override (MO) enables the valve to be actuated when not electrically activated or energised.

The valve is actuated by pushing the manual override. The set switching

status can also be locked by turning the manual override (code R or as accessory).

Alternatives:

- A cover (code N or as accessory) can be fitted over the manual override

to prevent it from being locked. The manual override can then only be activated by pushing it.

- A cover (code V) can be fitted over the manual override to prevent it from being accidentally activated.

## Pneumatic connection and control elements

- 1 Flat plate silencer for exhaust port 3/5
- 2 Manual override (for each pilot solenoid coil, non-detenting or non-detenting/detenting)
- 3 Adjusting knob of optional pressure regulator plate
- 4 Inscription label holder for manifold block
- 5 Working lines 2 and 4, for each valve position
- 6 Supply port 1
- 7 Pressure gauge (optional)
- 8 Ports 12 and 14 for supplying the external pilot air

**Note**  
A manually actuated valve (manual override) cannot be reset electrically. Conversely, an electrically actuated valve cannot be reset using the mechanical manual override.

## Electrical connection and display components on the AS-interface

- 1 M12 socket for AS-interface bus and additional supply (AS-i Out)
- 2 M12 plug for AS-interface bus and additional supply (AS-i In)
- 3 Earth terminal
- 4 Status LEDs for inputs
- 5 Status LEDs for AS-interface
- 6 Diagnostic LEDs for valves

# Valve terminals type 32 MPA

Key features – Display and operation

## Manual override (MO)

### MO with automatic return (non-detenting)

- 1 Press in the stem of the MO with a pin or screwdriver. Pilot valve switches and actuates the main valve.
- 2 Remove the pin or screwdriver. Spring force pushes the stem of the MO back. Pilot valve returns to its initial position and so too the single solenoid main valve (not with double solenoid valve code ).

### MO set via turning (detenting)

- 1 Press in the stem of the MO with a pin or screwdriver until the valve switches and then turn the stem clockwise by 90° until the stop is reached. Valve remains actuated.
- 2 Turn the stem anti-clockwise by 90° until the stop is reached and then remove the pin or screwdriver. Spring force pushes the stem of the MO back. Valve returns to its initial position (not with double solenoid valve code ).

## Inscription system

An inscription label holder VMPA1-ST-1-4 (Part No. 533 362, code T in the order code) or VMPA1-ST-2-4 (Part No. 544 384, for holding IBS-6x10 inscription labels) can be mounted on each manifold block with a width of 42 mm for labelling the valves.

Large inscription labels can be applied to the pneumatic interface as an alternative or complement to the smaller labels.

The following inscription labels can be used as spares:

- Inscription label MPA (20 x 45 mm): Part No. 663 010

# Valve terminals type 32 MPA

Key features – Electrical components

## Electrical power as a result of current reduction

Each MPA solenoid coil is protected with a spark arresting protective circuit as well as against polarity reversal. All valve types are additionally equipped with integrated current reduction.

MPA valves are supplied with operating voltage in the range 18 ... 30 V (24 V +/-25%). This high tolerance is made possible through integrated control electronics and offers additional security, e.g. if the operating voltage drops.

## Individual valve

Valves can also be used on individual sub-bases for actuators further away from the valve terminal.

- Detachable electronics module with integrated holding current reduction
- Electrical M8 connection, 4-pin with screw connection

## Electrical multi-pin plug connection

The following multi-pin plug connection is offered for the valve terminal MPA:

- Sub-D multi-pin plug connection (25-pin)

Pins 1 ... 24 are used for addresses 1 ... 24 in order.

If fewer than 24 addresses are used for the valve terminal, the remaining

pins up to 24 are left free. Pin 25 is reserved for the neutral conductor. The valves are switched by means of positive or negative logic (PNP or NPN). Mixed operation is not permitted.

Each pin on the multi-pin plug can actuate exactly one solenoid coil. If the maximum configurable number

of valve positions is 24, this means that 24 valves can be addressed with one solenoid coil.

With 12 or less valve positions, 2 solenoid coils per valve can be addressed.

With 12 or more valve positions, the number of available valve positions for valves with two solenoid coils decreases.

Note

If a single solenoid valve is assembled on a double solenoid valve position, the second address is also occupied and cannot be used.

## Guidelines on addressing for valves/solenoid coils

- The maximum possible number of addresses with a multi-pin plug connection is 24.
- Each manifold block/electronics module occupies a defined number of addresses/pins:
  - Manifold block MPA1 for 4 single solenoid valves: 4
  - Manifold block MPA1 for 4 double solenoid valves: 8
  - Manifold block MPA2 for 2 single solenoid valves: 2
  - Manifold block MPA2 for 2 double solenoid valves: 4
- The numbering of the addresses goes from left to right in ascending consecutive order. The following applies to the individual valve positions: address x for coil 14 and address x+1 for coil 12.
- If single solenoid valves are mounted on manifold blocks for double solenoid valves, the address of coil 12 and the assigned pin will remain unused.

## Valve terminals type 32 MPA

Key features – Electrical components

### AS-interface® fieldbus connection

The AS-interface facilitates the spatial distribution of individual components or small component groups.

The AS-interface connection of valve

terminal type 32 can be used to control up to 8 solenoid coils. The electrical connection of the valve

terminal contains the LEDs that indicate the operating status and the protective circuit for the valves.

Note

For further information see

➔ Internet: as-interface

### CPI fieldbus connection

All CP valve terminals and CP modules are connected using a ready-to-install CP cable, and are attached to the CP interface. Four modules, for example

one CPV valve terminal and one to three CP input modules, make up an installation string that ends at the CP interface. The installation system

supports a maximum of 4 installation strings that can be connected to a CP fieldbus node.

Note

For further information see

➔ Internet: ctec

### CPX fieldbus connection

All functions and features of the electrical peripherals CPX are supported in connection with the CPX interface. This means:

- The valves and electrical outputs are supplied via the operating voltage connection CPX
- The valves are supplied and disconnected separately via a separate valve connection on the CPX (code V)

Note

For further information see

➔ Internet: cpx

## Instructions for use

Equipment	Bio-oils	Mineral oils
Operate your equipment with unlubricated compressed air if possible. Festo valves and cylinders are designed so that, if used as designated, they will not require additional lubrication and will still achieve a long service life. The quality of compressed air downstream from the compressor must correspond to that of unlubricated compressed air. If possible, do not operate all of your equipment with lubricated compressed air. The lubricators should, where possible, always be installed directly upstream of the actuator used.	Unsuitable additional oil and an excessive oil content in the compressed air reduce the service life of the valve terminal. Use Festo special oil OFSW-32 or the alternatives listed in the Festo catalogue (as specified in DIN 51524 HLP32; basic oil viscosity 32 CST at 40 °C).	When using mineral oils (e.g. HLP oils to DIN 51524, parts 1 to 3) or similar oils based on poly-alpha-olefins (PAO), the maximum residual oil content of 5 mg/m <sup>3</sup> must not be exceeded (see ISO 8573-1 Class 4). A higher residual oil content irrespective of the compressor oil cannot be permitted, as the basic lubricant would be flushed out over time.

Technical data

Materials	
Manifold block	Die-cast aluminium
Valve	Die-cast aluminium
Seals	NBR, elastomer
Supply plate	Die-cast aluminium
Right-hand end plate	Die-cast aluminium
Left-hand pneumatic interface	Die-cast aluminium, polyamide
Exhaust plate	Polyamide
Flat plate silencer	Polyethylene
Electrical supply plate	Housing: die-cast aluminium Cover: reinforced polyamide
Electronics module	Polycarbonate
Electrical manifold module	Bronze/polybutylene terephthalate
Regulator plate	Control section, housing: polyamide; seals: nitrile rubber

## Vertical stacking components, MPA2

## Valve terminals type 32 MPA

Technical data – Proportional pressure regulator VPPM

Function:

-  - Flow rate  
380 ... 1,400 l/min
-  - Pressure regulation range  
0.02 ... 10 bar
-  - Voltage  
21.6 ... 26.4 V DC

General technical data			
Constructional design	Pilot actuated diaphragm regulator		
Sealing principle	Soft		
Actuation type	Electrical		
Type of control	Pilot actuated		
Mounting position	Any		
Reset method	Mechanical spring		
Pneumatic connection	1, 2, 3 Manifold block		
Nominal diameter	Pressurisation	[mm]	6
	Exhaust	[mm]	4.5
	Standard nominal flow rate		
	2 bar type	[l/min]	380
	6 bar type	[l/min]	900
	10 bar type	[l/min]	1,400
Product weight		[g]	400
Material	Housing		Wrought aluminium alloy, anodised

Electrical data			
Electrical connection	Via manifold block		
Operating voltage range	[V DC]	21.6 ... 26.4	
Residual ripple	10%		
Max. electrical power consumption	[W]	7	
Protection against short circuit	For all electrical connections		
Protection against polarity reversal	For all electrical connections		
Protection class to EN 60529	IP65

<b>Electronics modules</b>				
	For fieldbus connection, without isolated electrical circuit	4 coils MPA2	VMPA2-FB-EMS-4	537983
	For fieldbus connection, without isolated electrical circuit, with expanded diagnostics function	4 coils MPA2	VMPA2-FB-EMS-D2-4	543332
	For fieldbus connection, without isolated electrical circuit	8 coils MPA1	VMPA1-FB-EMS-8	533360
	For fieldbus connection, without isolated electrical circuit, with expanded diagnostics function	8 coils MPA1	VMPA1-FB-EMS-D2-8	543331
	For fieldbus connection, with isolated electrical circuit	4 coils MPA2	VMPA2-FB-EMG-4	537984
	For fieldbus connection, with isolated electrical circuit, with expanded diagnostics function	4 coils MPA2	VMPA2-FB-EMG-D2-4	543334
	For fieldbus connection, with isolated electrical circuit	8 coils MPA1	VMPA1-FB-EMG-8	533361
	For fieldbus connection, with isolated electrical circuit, with expanded diagnostics function	8 coils MPA1	VMPA1-FB-EMG-D2-8	543333
	For modular multi-pin plug connection (MPM)	2 coils MPA2	VMPA2-MPM-EMM-2	537985
		4 coils MPA2	VMPA2-MPM-EMM-4	537986
4 coils MPA1		VMPA1-MPM-EMM-4	537987	
8 coils MPA1		VMPA1-MPM-EMM-8	537988	
<b>Electrical module</b>				
	For proportional pressure regulator		VMPA-FB-EMG-P1	542224
<b>Electrical supply plate</b>				
	Plug connection M18, 3-pin		VMPA-FB-SP-V	541082
	Plug connection 7/8", 5-pin		VMPA-FB-SP-7/8-V-5POL	541083
	Plug connection 7/8", 4-pin		VMPA-FB-SP-7/8-V-4POL	541084
<b>Electrical manifold module for multi-pin plug connection and AS-interface</b>				
	For a manifold block	2 coils MPA2	VMPA2-MPM-EV-AB-2	537989
		4 coils MPA1, MPA2	VMPA1-MPM-EV-AB-4	537993
		8 coils MPA1	VMPA1-MPM-EV-AB-8	537994
	For a manifold block with pneumatic supply plate	2 coils MPA2	VMPA2-MPM-EV-ABV-2	537991
		4 coils MPA1, MPA2	VMPA1-MPM-EV-ABV-4	537995
		8 coils MPA1	VMPA1-MPM-EV-ABV-8	537996
<b>Electrical manifold module for fieldbus connection and CPI</b>				
	For a manifold block MPA1 and MPA2, for manifold block of the proportional pressure regulator		VMPA1-FB-EV-AB	537998
	For a pneumatic supply plate		VMPA1-FB-EV-V	537999
