

FESTO

Key features

#### Mode of operation

The camera not only contains the sensor system for image data acquisition, but also the complete electronic evaluation unit for image processing, an integrated PLC and the interfaces for communication with higher-level controllers.

The CheckKon and CheckOpti software tools make configuring the image processing task very straightforward. The user creates reference images with

the camera by presenting different sample parts and then defines the desired inspection criteria. These can include, for example, brightness, distance, angle and circularity, but also the reading of text and/or 1D or 2D codes. The sample parts define the tolerance range, within which parts are identified as good, for each inspection characteristic. Up to 256 characteristics can be combined

in a single program and up to 256 inspection programs can be stored on the camera.

The camera can also be used to carry out sorting functions, as it is capable of storing and distinguishing between up to 16 different part types per inspection program.

The characteristics calculated by the camera are not dependent on the rotary orientation and position of the

inspection part, as they are determined relative to the position of the inspection part – any tilting and/or movement of the inspection part in the field of vision is therefore irrelevant for the inspection process.

The behaviour of the camera during inspection is determined by the evaluation mode. There are four different modes.

Evaluation modes Mode	Function		Application
Triggered	Frame capture and inspection with each valid triggering signal. The triggering signal is generated by a master controller or a sensor as soon as the inspection part is in front of the	camera. The inspection results are output following the inspection, and the camera then waits for the next valid triggering signal.	Inspection of single parts when there is a triggering signal for image capture.
Idle run with image trigger with Compact Vision System SBOQ-RB	Image capture is performed continuously, but image evaluation only if there is an inspection part in front of the camera, i.e. if the trigger condition has been satisfied in a freely defined	image area (e.g. a specific brightness is exceeded/fallen below). The inspection results are output following the inspection. The camera then waits for the next image-based trigger.	Inspection of single parts at a medium to fast rate without an external sensor.
Idle run without image trigger	Image capture and inspection (without fixed frame rate) are performed continuously. The triggering signal is permanently present, irrespective of whether or not there is an inspection part in front of the camera. The	camera acts like a basic sensor. The inspection results are output following the inspection, and the camera then starts the next inspection immediately.	Inspection of single or continuous parts at a medium to fast (continuous) rate.
Fixed frame rate with Compact Vision Systems SBOQ-R1 and SBOQ-R2	Image capture and inspection are performed continuously at a defined frame rate. The triggering signal is permanently present. The inspection	results are output following the in- spection. The camera starts the next inspection in accordance with the defined frame rate.	Inspection of continuous parts at a constant speed.

#### Programming

Integrated PLC

The integrated PLC can be programmed in all programming languages covered by IEC 61131-3 (e.g. LDR, ST, sequential function chart, etc.) using the software tool CoDeSys provided by Festo. The predefined function blocks enable straight-

forward data exchange between the image processing task and the integrated PLC.

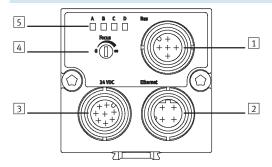

This provides an easy means of implementing extensive inspection tasks or even communication between different cameras.

**FESTO** 

Key features

#### Interfaces

#### Connection and display components

- 1 Fieldbus connection for Compact Vision Systems SBO...-Q-R1 and SBO...-Q-R2
- 2 Ethernet connection
- 3 Operating voltage supply and inputs/outputs
- 4 Adjusting screw for focus
- 5 Status LEDs:
  - A Ready status
  - B Ethernet traffic
  - C Activity
  - D Output

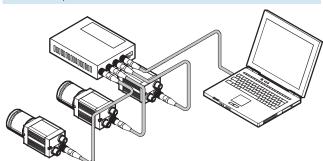

#### Innuts:

- Camera trigger
- Error acknowledgment

Outputs (can be parameterised):

- Ready status
- Good part correctly oriented
- Good part incorrectly oriented
- Reject part
- Error
- Warning
- External lighting

#### Ethernet - TCP/IP

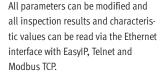

Commissioning and diagnostics:

- PC for configuration and for diagnostics with TCP/IP
- Integration of the camera in a corporate network (integrated web server)
- Visualisation of the camera images and inspection results via SBO...-Q WebViewer

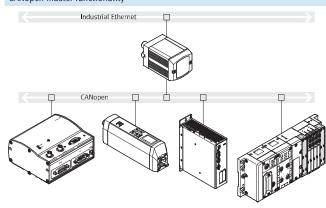

Ethernet – TCP/IP, EasyIP, Telnet, Modbus TCP

- Front End Display FED, e.g. for teach-in, status signals, type selection or parameter modification
- Robot controllers and programmable logic controllers, e.g. CECX for reading characteristic values (e.g. coordinates and rotation angle)

#### CANopen master functionality

Servo controllers and remote I/O can be addressed directly via the CANopen master functionality.

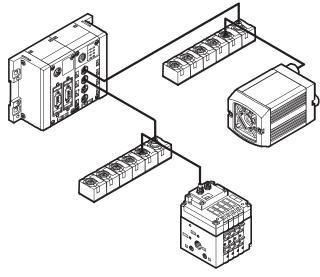

**FESTO** 

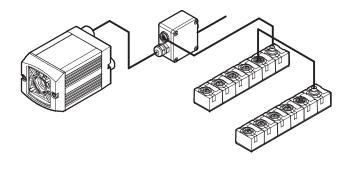

Key features

#### Interfaces (continued)

CAN – Vision system as CPI module
For Compact Vision Systems SBO...-Q-R1 and SBO...-Q-R2

CAN – I/O expansion
For Compact Vision Systems SBO...-Q-R1 and SBO...-Q-R2

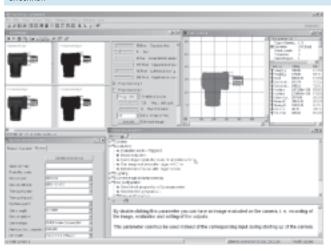

- The Compact Vision System SBO...-Q
   can be integrated into a Festo CPI
   network. In this case it functions
   like a binary module with 16 inputs
   and outputs.
- In combination with a CPX-CPI module and a CPX fieldbus node, for example, the camera can be accessed via Profibus DP, Interbus, DeviceNet, CANopen and CC-Link.
- An input and output module can be connected to the camera via the camera's CAN interface.
- Input module CP-E08-M12-CL for binary preselection of the inspection program
- Output module
   CP-A04-M12-CL for binary
   signalling of part types

#### Software

CheckKon

Using the CheckKon software, all processes within the camera – from image capture to the input and output parameters – can be displayed, logged and modified.

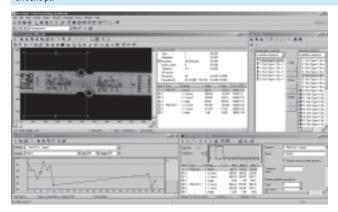

#### This includes:

- Selecting the evaluation mode
- Displaying and editing system parameters
- Displaying analysis of most recently inspected parts
- Displaying and logging inspection part images and the characteristics derived from them
- Loading new inspection programs
- System documentation

**FESTO** 

Key features

#### CheckOpti

CheckOpti is used to configure inspection programs. Following the presentation of sample parts, the user defines the characteristics to be inspected with the aid of the software. This is done by selecting the characteristics from a list and then dragging and dropping them to the area of the sample part to be inspected. A total of 256 performance characteristics can thus be defined and optimised within the framework of an inspection program. The inspection program can then be uploaded to one of the camera's 256 memory locations.

Examples of inspection characteristics:

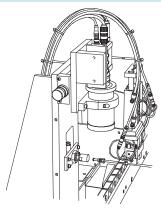

- Vertical length measurement
- Horizontal length measurement
- Angle measurement
- Counting of events
- Measurements on the inspection part contour
- Area definition
- Calculation of grey tone or colour differences

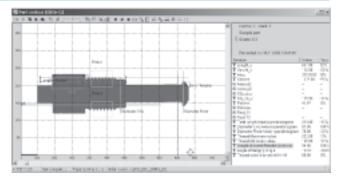

#### **Application examples**

Quality inspection of tube with union nut

The inspection takes place with backlighting; calculated characteristics:

- Length of nut
- Threaded coupling distances
- Diameter of tube
- Thread outside diameter
- $\,$   $\,$  Angle measurement on the flange  $\,$
- Circumference of the screw
- Area of the screw

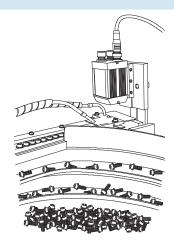

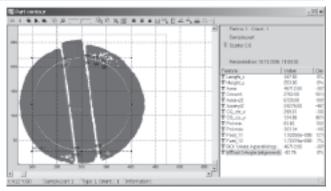

#### Screw type differentiation

The inspection takes place with reflected light; calculated characteristics:

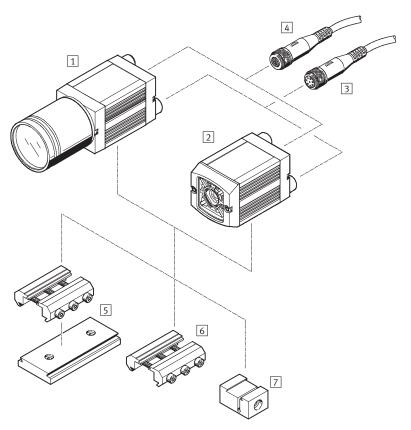

- Centre of gravity coordinates x, y
- Average grey tone of area
- Angle of screw drive to horizontal
