

Key features

#### At a glance

Accelerated vacuum reduction for safe placement of the workpiece by means of integrated solenoid valve for controlling the ejector pulse

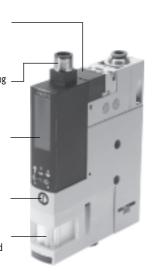

Central electrical connection via M12 plug -

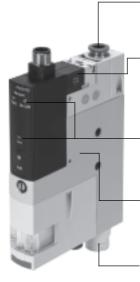

#### OVEM-...-2P/2N/PU/NU/PI/NI

Monitoring and visualisation of the vacuum by means of vacuum sensor with LCD display (inchHg)

Adjustment of the ejector pulse via flow control screw

Prevention of contamination of the vacuum generator by means of integrated filter

Quick and secure installation thanks to QS fitting

Fast vacuum build-up by means of integrated solenoid valve for controlling the compressed air supply

#### OVEM-...-1P/1N

Monitoring of the vacuum and status displays for switching output and solenoid valves by means of a vacuum sensor with LED display

Prevention of pressure drops by means of integrated non-return valve

Maintenance-free operation and reduced noise level through integrated, open silencer

#### The modular vacuum generator series

The modular vacuum generator series OVEM offers a wide range of individually selectable functions, making it possible to find a solution for the most varied of applications.

| Functions                       | Values  |  |
|---------------------------------|---|--|
| Laval nozzle                    | 0.45 mm   |  |
|                                 | 0.7 mm  |  |

2) Vacuum sensor with LED display

3) Vacuum sensor with LCD display

Key features

#### The innovative vacuum generator Economical

- Short switching times thanks to integrated solenoid valves
  - Vacuum on/off
  - Ejector pulse
- Quick, precise and safe placement of the workpiece by means of the ejector pulse
- Cost saving through preventive maintenance/service thanks to maintenance indicator

#### Reliable

- Permanent monitoring of the entire vacuum system via a vacuum sensor to reduce downtimes (condition monitoring)
- Prevention of pressure loss by means of an integrated air-saving function in conjunction with an integrated non-return valve

#### **Operating principle of OVEM** Vacuum ON/OFF

The compressed air supply is controlled by an integrated solenoid valve. The solenoid valve can be supplied with two different switching functions, NC and NO.

 NC - normally closed: The vacuum is generated when the vacuum generator is pressurised with compressed air and the solenoid valve has been switched.

#### Connection to higher-level systems

The connection to higher-level systems as well as the configuration of the switching outputs depends on the type of vacuum sensor.

## • Cost saving through integrated air-saving function

- Powerful supply of multiple vacuum generators via a common supply manifold (→ page 17)
- Low-cost variants with one switching output (OVEM-...-1P/1N)

#### Easy to use

- Simple installation via M12 plugs and QS fittings
- Simple mounting via screws
- All control elements on one side
- Quiet operation thanks to integrated silencers

#### Vacuum sensor with LCD display (OVEM-...-2P/2N/PU/NU/PI/N)

- Vacuum is displayed numerically and as a bar chart
- Important parameters and diagnostic information are displayed

#### Space-saving

• NO - normally open:

position.

All functions are compactly integrated in one unit

- No protruding elements such as valves or vacuum sensor
  Space-optimised installation is
- possible as all the control elements can be accessed from one side

The vacuum is generated when the

vacuum generator is pressurised

with compressed air and the

solenoid valve is in the normal

#### Easy to maintain

- Integrated filter with inspection window for maintenance display
- Reduced contamination of the vacuum generator thanks to an open silencer

#### Choice of mounting types

- Direct mounting or via mounting bracket
- Straightforward mounting on H-rail via accessories
- Blocking of multiple vacuum generators on a common supply manifold (→ page 17)

#### Vacuum sensor

The set or taught-in reference value for the generated vacuum is monitored via an integrated vacuum sensor. If the reference value is reached or if it is not reached due to malfunctions (e.g. leakages, dropped workpiece), the vacuum sensor emits an electrical signal.

#### Ejector pulse

With a second integrated solenoid valve, an ejector pulse is activated and generated after the vacuum is switched off to release the workpiece safely from the suction cup and to reduce the vacuum quickly.

## ems OVEM-...-1P/1N

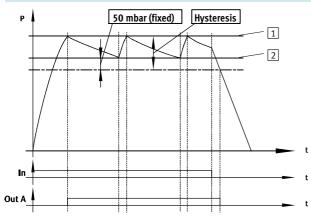

- Switching inputs for actuating the solenoid valves for vacuum generation and ejector pulse
- One switching output for supplying a control signal
  - Configured as an N/O contact
  - Switching function configured as a threshold value comparator

#### OVEM-...-2P/2N/PU/NU/PI/NI

- One digital switching input for actuating the solenoid valves
- Two digital switching outputs or one digital switching output and one analogue output for supplying control signals
- Switching outputs can be configured as N/C or N/O contacts
- Switching function of the outputs can be configured as a threshold value or window comparator
- If there are two switching outputs, these can be configured independently of each other. This enables tasks to be performed in parallel with one vacuum generator, reducing the time needed for sorting good and reject parts, for example.

Key features

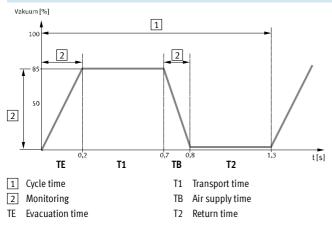

#### OVEM-...-2P/2N/PU/NU/PI/NI - Air-saving function LS (-CE, -OE)

If the desired threshold value 1 for the vacuum is reached, vacuum generation is automatically switched off. A non-return valve prevents the reduction of the vacuum. Nonetheless, leakage (e.g. due to rough workpiece surfaces) will slowly reduce the vacuum. If the pressure drops below the threshold value 2, vacuum generation is automatically switched on. Vacuum is generated until the set threshold value 1 is reached again.

FESTO

The main operating parameters

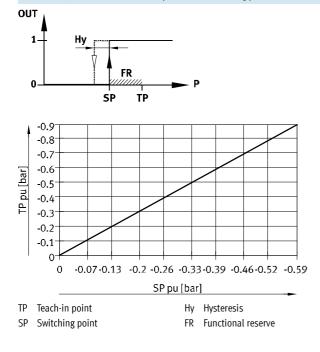

- vacuum
- evacuation time and
- air supply time

are continuously measured in the vacuum generator and compared with the individually set reference values (condition monitoring). If deviations in the reference values occur, these will be determined by the vacuum generator and shown on the display (diagnostics). An electrical signal will also be transmitted to the higher-order controller.

This permits preventative action

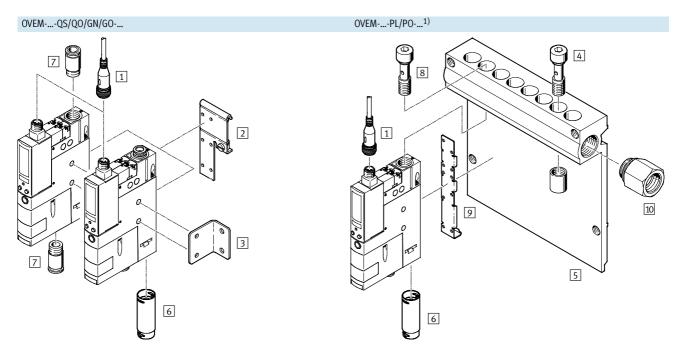

- in order to prevent machine failure or downtime, for example, through timely maintenance
- and to ensure process reliability (adherence to the cycle time).

#### OVEM-...-1P/1N - From the teach-in point to the switching point

The switching point is determined from the teach-in point and the functional reserve. A functional reserve (35% of the teach-in pressure) is subtracted from the teach-in pressure (SP = TP - 0.35\*TP). For example, a switching point of -0.33 bar is set at a teach-in pressure of -0.5 bar. The hysteresis is fixed.

# Vacuum generators OVEM, NPT Peripherals overview

1) Hollow bolt [8] and mounting bracket [9] are included in the scope of delivery of the OVEM-...-PL/PO-.... Adapter 10 is included in the scope of delivery of the common supply manifold OABM-P....

## Vacuum generators OVEM, NPT Technical data

- Function
- NC, normally closed:
- Ejector pulse
- QS fitting (inch) or NPT female thread
- With open silencer
- Prepared for common supply manifold
- NO, normally open:
- Ejector pulse
- QS fitting (inch) or NPT female thread
- With open silencer
- Prepared for common supply manifold

1) Corrosion resistance class 2 according to Festo standard 940 070

Components subject to moderate corrosion stress. Externally visible parts with primarily decorative surface requirements which are in direct contact with a normal industrial environment or media such as coolants or lubricating agents.

For information about the applicability of the component see the manufacturer's EC declaration of conformity at: www.festo.com 🗲 Support 🗲 User documentation. 2)

If the component is subject to restrictions on usage in residential, office or commercial environments or small businesses, further measures to reduce the emitted interference may be necessary.

1) With a tubing length of 3 m

#### Note

The total air consumption of the fully equipped common supply manifold can be determined by adding the individual consumption of each generator used. Note that in the case of vacuum generators with ejector pulse (OE, CE), the individually set values for the ejector pulse (duration and intensity) can result in much higher air consumption.
