Overview of toothed belt and spindle axes

Toothed belt axes

- Speeds of up to 10 m/s
- Acceleration of up to 50 m/s²
- Repetition accuracy of up to +0.08 mm
- Strokes of up to 8,500 mm (longer strokes on request)
- Flexible motor mounting

Spindle axes

- Speeds of up to 2 m/s
- Acceleration of up to 20 m/s²
- Repetition accuracy of up to +0.003 mm
- Strokes of up to 3,000 mm

Toothed belt axes

Electric slides EGSK/EGSP

Key features

FESTO

At a glance

Precision embedded in steel

The new generation of electric slide axes EGSK and EGSP impresses with its precision, repetition accuracy, compactness and rigidity.

The two axis series form a complete range with a uniform design, long service life and standardised mounting interfaces. The U-shaped steel housing serves simultaneously as

a guide rail. The slide combines linear guide elements and the spindle nuts of the ball screw in one component, thus avoiding the accumulation of production tolerances.

Both series come in three accuracy classes with the option of an additional slide (series 33 and 46 are also available in a short-slide design).

Electric slide EGSK

- Recirculating ball bearing guide and ball screw without caged balls
- Standard designs available ex-stock

Electric slide EGSP

- Recirculating ball bearing guide with caged balls
- Size 33, 46 features a ball screw with caged balls
- Low-maintenance
- Uniform operating behaviour with very low noise levels

Linear guide with caged balls

The linear guide features four rows of balls circulating within the guide carriage. In the loaded area, the balls run between the honed grooves of the guide carriage and guide rail until they are returned by means of the reversers in the end plates and the return channels. The very rigid design of the guide carriage enables precision

linear movements to be executed with impressive dynamism. The four rows of balls are arranged at a contact angle of 45°, giving the guide carriage the same basic load ratings in both radial coordinate directions. This type of guide can therefore be used in any mounting position for a wide range of load directions.

Axis characteristics

The specifications shown in the table are maximum values.

The precise values for each of the variants can be found in the relevant technical data section.

Electric slides EGSK/EGSP

Peripherals overview

Accessories		
Type	Brief description	→ Page/Internet
1 Cross connecting kit EHAM-S1	For mounting an assembly axis EGSK/EGSP at right angles on the slide of a basic axis EGSK/EGSP. The assembly axis is one size smaller than the respective basic axis.	39
2 Covering kit EASC-S1	For covering the axis profile that is open at the top. The kit includes a slide adapter EASA-S1.	41
3 Slide adapter EASA-S1	Required to mount the effective load in combination with the covering kit for axis variants with additional slide.	40
4 Sensor strip EAPR-S1-S	- For mounting the inductive proximity sensor SIES-8M on the electric slide. - Switching lugs are included in the scope of delivery.	43
5 Proximity sensor SIES-8M	Inductive proximity sensor, for T-slot.	44
6 Axial kit EAMM-A	For axial motor mounting (comprising: coupling and motor flange).	37
7 Motor EMMS	Motors specially matched to the axis, with or without brake.	37
8 Centring pin ZBS	For centring loads and attachments on the slide.	44
9 Centring pin ZBS	For centring loads and attachments on the slide adapter.	44

1 Representation of the loads

2 Determination of the loads over the travel cycle

$$q_1 = \frac{t_1}{t_{tot}} \quad q_2 = \frac{t_2}{t_{tot}} \quad q_3 = \frac{t_3}{t_{tot}}$$

$$t_{tot} = t_1 + t_2 + t_3$$

v	Speed
t ₁	Acceleration time
t ₂	Constant travel time
t ₃	Deceleration time
q _{1/2/3}	Relative time of the cycle phases
t _{tot}	Cycle time

Ball screw

$$\text{For } t_1: F_{x1} = - (m \times a) - (M_{\text{No-load}} \times \frac{2\pi}{P})$$

$$\text{For } t_2: F_{x2} = - (M_{\text{No-load}} \times \frac{2\pi}{P})$$

$$\text{For } t_3: F_{x3} = m \times a - (M_{\text{No-load}} \times \frac{2\pi}{P})$$

$$F_{x,\text{dyn}} = \sqrt[3]{q_1 \times |F_{x1}|^3 + q_2 \times |F_{x2}|^3 + q_3 \times |F_{x3}|^3}$$

F _{x1/2/3}	Calculated force load per cycle phase
F _{x,dyn}	Calculated average force load
m	Effective load (centre of gravity)
a	Acceleration
M _{No-load}	No-load torque → 9
P	Spindle pitch → 9
q _{1/2/3}	Relative time of the cycle phases

2 Determination of the loads over the travel cycle		
Linear guide		
For t_1 : $a \rightarrow, v \rightarrow$		
$F_{y1} = 0$	$F_{y1/2/3}$	Calculated force load per cycle phase
$F_{z1} = m \times g$	$F_{z1/2/3}$	
$M_{x1} = F_z \times y_0 = m \times g \times y_0$	$M_{x1/2/3}$	Calculated torque load per cycle phase
$M_{y1} = -F_z \times x_0 + F_x \times z_0 = -m \times g \times x_0 + m \times a \times z_0$	$M_{y1/2/3}$	
$M_{z1} = F_x \times y_0 = m \times a \times y_0$	$M_{z1/2/3}$	
For t_2 : $a = 0, v \rightarrow$	$F_{y/z,dyn}$	Calculated average force load
$F_{y2} = 0$	$M_{x/y/z,dyn}$	Calculated average torque load
$F_{z2} = m \times g$	m	Effective load (centre of gravity)
$M_{x2} = F_z \times y_0 = m \times g \times y_0$	g	Gravitational acceleration
$M_{y2} = -F_z \times x_0 = -m \times g \times x_0$	a	Acceleration
$M_{z2} = 0$	x_0, y_0, z_0	Distances between the centre of gravity of the effective load and the slide centre point
For t_3 : $a \leftarrow, v \rightarrow$		
$F_{y3} = 0$		
$F_{z3} = m \times g$	$q_{1/2/3}$	Relative time of the cycle phases
$M_{x3} = F_z \times y_0 = m \times g \times y_0$		
$M_{y3} = -F_z \times x_0 - F_x \times z_0 = -m \times g \times x_0 - m \times a \times z_0$		
$M_{z3} = -F_x \times y_0 = -m \times a \times y_0$		
$F_{y,dyn} = \sqrt[3]{q_1 \times F_{y1} ^3 + q_2 \times F_{y2} ^3 + q_3 \times F_{y3} ^3}$		
$F_{z,dyn} = \sqrt[3]{q_1 \times F_{z1} ^3 + q_2 \times F_{z2} ^3 + q_3 \times F_{z3} ^3}$		
$M_{x,dyn} = \sqrt[3]{q_1 \times M_{x1} ^3 + q_2 \times M_{x2} ^3 + q_3 \times M_{x3} ^3}$		
$M_{y,dyn} = \sqrt[3]{q_1 \times M_{y1} ^3 + q_2 \times M_{y2} ^3 + q_3 \times M_{y3} ^3}$		
$M_{z,dyn} = \sqrt[3]{q_1 \times M_{z1} ^3 + q_2 \times M_{z2} ^3 + q_3 \times M_{z3} ^3}$		
3 Total load		
Ball screw		
$\frac{ F_{x,dyn} }{F_{x,max}} \leq f_v$	$F_{x,dyn}$	Calculated average force load
	$F_{x,max}$	Max. permissible force load → 9
	f_v	Load comparison factor → 16
Linear guide		
$\frac{ F_{y,dyn} }{F_{y,max}} + \frac{ F_{z,dyn} }{F_{z,max}} + \frac{ M_{x,dyn} }{M_{x,max}} + \frac{ M_{y,dyn} }{M_{y,max}} + \frac{ M_{z,dyn} }{M_{z,max}} \leq f_v$	$F_{y/z,dyn}$	Calculated average force load
	$F_{y/z,max}$	Max. permissible force load → 12
	$M_{x/y/z,dyn}$	Calculated average torque load
	$M_{x/y/z,max}$	Max. permissible torque load → 12
	f_v	Load comparison factor → 16

4 Determination of the load comparison factor f_v

$$f_v = \frac{1}{\sqrt[3]{q}} \quad \text{with} \quad q = \frac{L_{\text{calc,km}}}{L_{\text{ref,km}}} = \frac{L_{\text{calc,rot}}}{L_{\text{ref,rot}}}$$

for $q = 1$:

Calculated service life (here desired service life) $L_{\text{calc,km}} = 1 \times$ reference service life $L_{\text{ref,km}}$
gives $f_v = 1$

for $q \neq 1$:

Calculated service life (here desired service life) $L_{\text{calc,km}} = q \times$ reference service life $L_{\text{ref,km}}$
read off (→ graph) or calculate f_v

1 → Example 1

2 → Example 2

f_v	Load comparison factor
q	Quotient of desired service life divided by reference service life
$L_{\text{calc, km}}$	Calculated service life in km
$L_{\text{ref, km}}$	Reference service life in km → 14
$L_{\text{calc, rot}}$	Calculated service life in rotations
$L_{\text{ref, rot}}$	Reference service life in rotations → 14

5 Calculation examples

Example 1:

EGSK-26-...-2P-H...

$L_{\text{ref,km}} = 1,000 \text{ km}$

$L_{\text{calc,km}} = 2,000 \text{ km}$

$$q = \frac{2000\text{km}}{1000\text{km}} = 2.0$$

$$f_v = \frac{1}{\sqrt[3]{q}} = 0.79$$

Result:

A desired service life of 200% of the reference service life means that the permissible total load must be 21% lower.

Example 2:

If the total load calculation gives a load comparison factor f_v of 1.2, the mathematical service life is only approx. 60% ($x = 0.6$ → graph) of the reference service life.

$$q = \frac{1}{f_v^3} = 0.58$$

6 Static sizing

Ball screw

$$F_{x,\text{stat}} = \text{Max}[F_{x1}, F_{x2}, F_{x3}] \leq \frac{C_{0,\text{KGT}}}{f_s}$$

$F_{x,\text{stat}}$	Maximum value of the calculated force load per cycle phase
$F_{x1/2/3}$	Calculated force load per cycle phase

$C_{0,\text{KGT}}$	Static basic load rating of ball screw → 12
f_s	Safety factor against static overload $f_s = 1.0 \dots 3.0$

Linear guide

$$F_{y,\text{stat}} = \text{Max}[F_{y1}, F_{y2}, F_{y3}] \leq \frac{C_{0,\text{guide}}}{f_s}$$

$$F_{z,\text{stat}} = \text{Max}[F_{z1}, F_{z2}, F_{z3}] \leq \frac{C_{0,\text{guide}}}{f_s}$$

$$M_{x,\text{stat}} = \text{Max}[M_{x1}, M_{x2}, M_{x3}] \leq \frac{1}{k_x} \times \frac{C_{0,\text{guide}}}{f_s}$$

$$M_{y,\text{stat}} = \text{Max}[M_{y1}, M_{y2}, M_{y3}] \leq \frac{1}{k_y} \times \frac{C_{0,\text{guide}}}{f_s}$$

$$M_{z,\text{stat}} = \text{Max}[M_{z1}, M_{z2}, M_{z3}] \leq \frac{1}{k_z} \times \frac{C_{0,\text{guide}}}{f_s}$$

$F_{y/z,\text{stat}}$	Maximum value of the calculated force load per cycle phase
$M_{x/y/z,\text{stat}}$	Maximum value of the calculated torque load per cycle phase
$F_{y1/2/3}$ $F_{z1/2/3}$	Calculated force load per cycle phase

$M_{x1/2/3}$, $M_{y1/2/3}$, $M_{z1/2/3}$	Calculated torque load per cycle phase
$C_{0,\text{guide}}$	Static basic load rating of ball screw → 13
$k_{x/y/z}$	Torque equivalence factors → 13
f_s	Safety factor against static overload $f_s = 1.0 \dots 3.0$

1) Variant code → 24

2) Maximum travel distance → 33

In combination with an additional slide, the working stroke is reduced by the length of the additional slide and the distance between the two slides

3) Loads are based on a service life specification of 5 x 10⁸ rotations

4) Loads are based on a service life specification of 2.5 x 10⁸ rotations

5) Reduced speeds with sizes 33 and 46 with long strokes → 27

4 Determination of the load comparison factor f_v

$$f_v = \frac{1}{\sqrt[3]{q}} \quad \text{with} \quad q = \frac{L_{\text{calc,km}}}{L_{\text{ref,km}}} = \frac{L_{\text{calc,rot}}}{L_{\text{ref,rot}}}$$

for $q = 1$:

Calculated service life (here desired service life) $L_{\text{calc,km}} = 1 \times$ reference service life $L_{\text{ref,km}}$
gives $f_v = 1$

for $q \neq 1$:

Calculated service life (here desired service life) $L_{\text{calc,km}} = q \times$ reference service life $L_{\text{ref,km}}$
read off (→ graph) or calculate f_v

1 → Example 1

2 → Example 2

f_v	Load comparison factor
q	Quotient of desired service life divided by reference service life
$L_{\text{calc, km}}$	Calculated service life in km
$L_{\text{ref, km}}$	Reference service life in km → 30
$L_{\text{calc, rot}}$	Calculated service life in rotations
$L_{\text{ref, rot}}$	Reference service life in rotations → 30

5 Calculation examples

Example 1:

EGSP-26-...-2P-H...

$L_{\text{ref,km}} = 1,000 \text{ km}$

$L_{\text{calc,km}} = 2,000 \text{ km}$

$$q = \frac{2000\text{km}}{1000\text{km}} = 2.0$$

$$f_v = \frac{1}{\sqrt[3]{q}} = 0.79$$

Result:

A desired service life of 200% of the reference service life means that the permissible total load must be 21% lower.

Example 2:

If the total load calculation gives a load comparison factor f_v of 1.2, the mathematical service life is only approx. 60% ($x = 0.6$ → graph) of the reference service life.

$$q = \frac{1}{f_v^3} = 0.58$$

6 Static sizing

Ball screw

$$F_{x,\text{stat}} = \text{Max}[F_{x1}, F_{x2}, F_{x3}] \leq \frac{C_{0,\text{KGT}}}{f_s}$$

$F_{x,\text{stat}}$

Maximum value of the calculated force load per cycle phase

$C_{0,\text{KGT}}$

Static basic load rating of ball screw → 28

$F_{x1/2/3}$

Calculated force load per cycle phase

f_s

Safety factor against static overload
 $f_s = 1.0 \dots 3.0$

Linear guide

$$F_{y,\text{stat}} = \text{Max}[F_{y1}, F_{y2}, F_{y3}] \leq \frac{C_{0,\text{guide}}}{f_s}$$

$F_{y/z,\text{stat}}$

Maximum value of the calculated force load per cycle phase

$M_{x1/2/3},$

$M_{y1/2/3},$

$M_{z1/2/3}$

Calculated torque load per cycle phase

$$F_{z,\text{stat}} = \text{Max}[F_{z1}, F_{z2}, F_{z3}] \leq \frac{C_{0,\text{guide}}}{f_s}$$

$M_{x/y/z,\text{stat}}$

Maximum value of the calculated torque load per cycle phase

$C_{0,\text{guide}}$

Static basic load rating of ball screw → 29

$$M_{x,\text{stat}} = \text{Max}[M_{x1}, M_{x2}, M_{x3}] \leq \frac{1}{k_x} \times \frac{C_{0,\text{guide}}}{f_s}$$

$F_{y1/2/3},$

$F_{z1/2/3}$

Calculated force load per cycle phase

$k_{x/y/z}$

Torque equivalence factors → 29

$$M_{y,\text{stat}} = \text{Max}[M_{y1}, M_{y2}, M_{y3}] \leq \frac{1}{k_y} \times \frac{C_{0,\text{guide}}}{f_s}$$

f_s

Safety factor against static overload
 $f_s = 1.0 \dots 3.0$

$$M_{z,\text{stat}} = \text{Max}[M_{z1}, M_{z2}, M_{z3}] \leq \frac{1}{k_z} \times \frac{C_{0,\text{guide}}}{f_s}$$
