Type codes

Shock absorbers DYSR

Technical data

Function

-  Size
8 ... 32
-  Stroke length
8 ... 60 mm

General technical data						
Size	8	12	16	20	25	32
Stroke [mm]	8	12	20	25	40	60
Mode of operation	Hydraulic shock absorber with spring return Single acting, pushing					
Cushioning	Adjustable, force-dependent, hard characteristic curve					
Cushioning length [mm]	8	12	20	25	40	60
Type of mounting	Via lock nut					
Impact velocity [m/s]	0.1 ... 3					
Mounting position	Any					
Product weight [g]	60	105/120 ¹⁾	200/250 ¹⁾	355/425 ¹⁾	715	1,355
Ambient temperature [°C]	-10 ... +80					
Corrosion resistance class CRC ²⁾	1					

- 1) Applies to shock absorbers with special thread T
- 2) Corrosion resistance class 1 according to Festo standard 940 070
Components subject to low corrosion stress. Transport and storage protection. Parts that do not have primarily decorative surface requirements, e.g. in internal areas that are not visible or behind covers

Reset time [s]						
Size	8	12	16	20	25	32
Reset time ¹⁾	≤ 0.2		≤ 0.3		≤ 0.4	≤ 0.6

- 1) The specified technical data refers to ambient temperature. At -10 °C, the reset time can be up to 1 s for sizes 12, 16 and up to 3 s for sizes 8, 20, 25, 32

Force [N]						
Size	8	12	16	20	25	32
Min. insertion force ¹⁾	18	38	66	110	155	175
Max. stop force ²⁾ in the end positions	400	900	1,600	2,500	4,000	6,400
Min. resetting force ³⁾	1.8	4.5	5.4	9	12.5	18

- 1) This is the minimum force that must be applied so that the shock absorber is pushed precisely into the retracted end position. This value is reduced correspondingly with an extended external end position
- 2) If the maximum stop force is exceeded, a fixed stop (e.g. YSRA) must be fitted 0.5 mm before the end of stroke
- 3) This is the maximum force that can act on the piston rod, allowing for full extension of the shock absorber (e.g. protruding bolt)

Energy [J]						
Size	8	12	16	20	25	32
Max. energy absorption per stroke	4	10.8	32	62.5	160	384
Max. energy absorption per hour	24,000	60,000	100,000	135,000	220,000	330,000
Max. residual energy	0.01	0.05	0.16	0.32	0.8	2

Note
To increase the service life:
Avoid the ingress of dirt or fluids into the piston chamber via the piston rod by, for example, using a cover.

Technical data

FESTO

Function

-  Size
5 ... 8 mm
-  Stroke length
7.5 ... 13.5 mm

General technical data			
Size	5	7	8
Stroke [mm]	8	10	14
Mode of operation	A piston rod in front of the shock absorber transmits the force to the shock absorber. This serves as the end stop and actuates the proximity sensor via a magnet mounted on it		
	Single acting, pushing		
Cushioning	Self-adjustable		
Cushioning length [mm]	8	10	14
Type of mounting	With locknut		
Position sensing	Via proximity sensor		
Impact velocity [m/s]	0.05 ... 2	0.05 ... 3	
Repetition accuracy [mm]	0.02		
Mounting position	Any		
Product weight [g]	45	75	110
Ambient temperature [°C]	0 ... +60		
Corrosion resistance class CRC ¹⁾	2		

- 1) Corrosion resistance class 2 to Festo standard 940 070
Components subject to moderate corrosion stress. Externally visible parts with primarily decorative surface requirements which are in direct contact with a normal industrial environment or media such as coolants or lubricating agents

Reset time [s]			
Size	5	7	8
Reset time ¹⁾	≤ 0.2		

- 1) The specified technical data refers to ambient temperature. At higher temperatures in the 80 °C range, the max. mass and the cushioning work must be reduced by 50% approx.
At 0 °C, the reset time may be up to 1 second

Forces [N]			
Size	5	7	8
Min. insertion force ¹⁾	5	18	80
Max. stop force ²⁾ in end positions	200	300	500
Min. resetting force ³⁾	1.5	2	3.5

- 1) This is the minimum force that must be applied so that the shock absorber is pushed exactly into the retracted end position
2) Impact force may not exceed the maximum specified value
3) This is maximum force that can be exerted on the piston rod so that the shock absorber advances fully

Energies [J]			
Size	5	7	8
Max. energy absorption per stroke	1	2	3
Max. energy absorption per hour	10,000	15,000	21,000
Max. residual energy	0.01	0.02	

Mass range [kg]			
Size	5	7	8
Permissible mass range up to	2	5	10

Calculation tool for cushioning components

Technical data

This selection aid helps you find the right shock absorber for every application.

When you are choosing a shock absorber, we recommend that you proceed as follows:

1. Determine the following values, effective at the time of impact:
 - Force (A)
 - Equivalent mass m_{equiv}
 - Impact velocity (v)
2. Select a shock absorber from the graphs on the following pages.
3. Check your selection on the basis of its maximum cushioning energy ($W_{max.}$)

 Note

Sizing software
Shock absorber selection
→ www.festo.com

When you are choosing a shock absorber for your application, ensure that the following values are not exceeded:

- Permissible energy load per stroke:
 - $W_{min.} = 25\%$
 - $W_{max.} = 100\%$
- Recommended energy load per stroke:
 - $W_{opt.} = 50\% \dots 100\%$
- Max. energy absorption per hour
- Max. residual energy
- Max. stop force in end position

The (angular) velocity required in the formulae is the velocity at the time of the impact on the shock absorber. This depends on the dynamic characteristics of the drive component and is thus difficult to determine.

It is better to determine the mean velocity ($v_m = s/t$ or $\omega_m = \varphi/t$).

In order to prevent damage to the drive concerned, calculations should in the interests of safety be based on the following values:

$$v = 1.25 \dots 2 v_m$$

$$\omega = 1.25 \dots 2 \omega_m$$

Guide values for linear motions:

Factor 2 with strokes < 50 mm,
factor 1.5 with strokes > 50 mm and < 100 mm,
factor 1.25 with strokes > 100 mm.

The fact that the (angular) velocity appears in the calculation as a squared value means that the expected error becomes considerably larger. The calculation can thus be regarded only as an approximation. The safety factor does, however, ensure that the selected shock absorber is not too small.

The following formulae are required for the calculation:

$$A = F + G$$

$$A = F + m \times g \times \sin \alpha$$

$$W_{total} = \frac{1}{2} \times m \times v^2 + A \times s < W_{max.}$$

$$W_h = W_{total} \times \text{Stroke} \div \text{Hours} < W_{hmax.}$$

The following applies additionally for rotary motions:

$$m_{equiv.} = \frac{J}{R^2}$$

$$v = \omega \times R$$

$$A = \frac{M}{R} + m \times g \times \sin \alpha \times \frac{a}{R}$$

The following abbreviations are used:

- | | | |
|---|--|--|
| A = Additional force = F + G [N] | v = Impact velocity [m/s] | J = Mass moment of inertia [kg x m ²] |
| F = Cylinder force minus frictional force [N] | $m_{equiv.}$ = Equivalent mass [kg] | R = Distance between mass pivot point and shock absorber [m] |
| G = Force due to weight = $m \times g \times \sin \alpha$ | g = Acceleration due to gravity 9.81 [m/s ²] | ω = Angular velocity [rad/s] |
| | s = Shock absorber stroke [m] | M = Drive torque [Nm] |
| | α = Impact angle [°] | a = Distance between centre of gravity of mass and pivot point |
| Special cases: | W_{total} = Cushioning work/stroke [J] | |
| $\alpha = 0^\circ$: Horizontal motion
G = 0 | W_h = Cushioning work/hour [J] | |
| $\alpha = 90^\circ$: Downward motion
G = $m \times g$ | | |
| $\alpha = 90^\circ$: Upward motion
G = $-m \times g$ | | |

Sizing example for linear motion

This example illustrates the procedure for the selection of a shock absorber for the application shown in the adjacent drawing:

$m = 50 \text{ kg}$
 $v = 1.5 \text{ m/s}$
 $\alpha = 45^\circ$
 $F = 190 \text{ N}$

$$A = F + m \times g \times \sin \alpha$$

$$= 190 \text{ N} + 50 \times 9.81 \times \sin 45^\circ$$

$$= 537 \text{ N}$$

$$m_{\text{equiv}} = m = 50 \text{ kg}$$

($\varnothing 20 \text{ mm}$ with $p = 6 \text{ bar}$,
 1,800 strokes per hour)

In the process of selecting shock absorbers on the basis of the graphs (see data sheets), the force (A) is governed by the first curve to the right of the point of intersection of the equivalent mass (m_{equiv}) and the impact velocity (v). The curves move to the left as the additional force increases.

Three force curves are given for each shock absorber. Interim values must be calculated by averaging. As the

graphs show (continuous line), possible choices are the shock absorbers DYSR-25-40 and YSR-25-40-C. We must now determine whether the maximum permissible values for cushioning work (W_{max}) and cushioning work per hour (W_{hmax}) are not being exceeded. These maximum permissible values and the stroke length (s) can be found in the tables (below the graphs).

Experiment:

$$W_{\text{total}} = \frac{1}{2} \times m \times v^2 + A \times s$$

$$= \left(\frac{1}{2} \times 50 \times 1.5^2 + 537 \times 0.04 \right) \text{ Nm} = 78 \text{ J}$$

$$W_{\text{h}} = W_{\text{total}} \times \text{strokes/h}$$

$$= 78 \text{ Nm} \times 1,800$$

$$= 140,000 \text{ J}$$

For the above application, both shock absorbers are suitable. Further selection criteria are adjustment facilities and size.

Result	DYSR-25-40	YSR-25-40-C
W_{total}	78 J	78 J
W_{h}	140,000 J	140,000 J
$W_{\text{max.}}^{1)}$	160 J > W_{total}	160 J > W_{total}
$W_{\text{hmax.}}$	220,000 > W_{h}	150,000 > W_{h}

1) The degree of utilisation is 49% in both cases.

Sizing example for rotary motion

Example for rotary motion:

$$m_{\text{equiv}} = J/R^2 = 8 \text{ kg}$$

$$v = \omega \times R$$

$$A = M/R = 40 \text{ N}$$

$$J = 2 \text{ kg m}^2$$

$$\omega = 4 \text{ rad/s}$$

$$R = 0.5 \text{ m}$$

$$M = 20 \text{ Nm}$$

900 strokes per hour

In the process of selecting shock absorbers on the basis of graphs (see data sheets), the force (A) is governed by the first curve to the right of the point of intersection of the equivalent mass (m_{equiv}) and the impact velocity (v). The curves move to the left as the additional force increases.

Three force curves are given for each shock absorber. Interim values must be calculated by averaging. As the graphs show (dotted line), possible choices are the shock absorbers DYSR-16-20 and YSR-16-20-C.

We must now determine whether the maximum permissible values for cushioning work (W_{max}) and cushioning work per hour (W_{hmax}) are not being exceeded. These maximum permissible values and the stroke length (s) can be found in the tables (below the graphs).

Note: The impact angle must be noted with rotary applications.

$$\tan \alpha = \frac{s}{R}$$

s = Cushioning stroke

Experiment:

$$\begin{aligned} W_{\text{total}} &= \frac{1}{2} \times m \times v^2 + A \times s \\ &= \left(\frac{1}{2} \times 8 \times 2^2 + 40 \times 0.02 \right) \text{ J} = 17 \text{ J} \end{aligned}$$

$$\begin{aligned} W_{\text{h}} &= W_{\text{total}} \times \text{strokes/h} \\ &= 17 \text{ J} \times 900 \\ &= 15,300 \text{ J} \end{aligned}$$

For the above application, both shock absorbers are suitable. Further selection criteria are adjustment facilities and size.

Result	DYSR-16-20 ³⁾	YSR-16-20-C
W_{total}	17 J	17 J
W_{h}	15,300 J	15,300 J
W_{max}	32 J > W_{total} ¹⁾	30 J > W_{total} ²⁾
W_{hmax}	100,000 > W_{h}	64,000 > W_{h}

- 1) The degree of utilisation is 53%.
- 2) The degree of utilisation is 57%.
- 3) Use without buffer.
