

Key features

#### Innovative

- Ideal housing surface design ensures that cleaning agents can run off, thus significantly reducing time and effort spent on cleaning
- Flow rate up to 780 l/min
- Sub-D multi-pin plug connection, front or rear
- I-Port interface/IO-Link, front or rear

#### Versatile

- Valves in individual grid
- Freely extendable system with individual sub-bases and modular tie rods
- Up to 32 solenoid coils
- Easy subsequent conversion and extension
- Air supply can be extended using additional pressure zones with power supply modules or sub-bases with an additional power supply
- Wide pressure range -0.9 ... 8 bar
- Wide range of valve functions

#### Reliable

- Use of materials that are resistant to corrosion and media
- Fast troubleshooting thanks to LEDs on the valves
- Easy to service thanks to replaceable valves
- Manual override, optionally
   non-detenting
- Efficient sealing thanks to 5 tie rods and redundant seals
- NSF-H1 greasing, FDA-compliant materials

#### Easy to assemble

- Supplied as ready-to-assemble, inspected unit
- Individually configurable pneumatic connections (straight or angled fittings, or with screw-in thread)
- Reduced outlay on selection, ordering, assembly and commissioning
- Excellent corrosion resistance and degree of protection (IP69K) enable assembly under harsh ambient conditions outside of a control cabinet

Key features

Key features

#### Multi-pin plug connection

#### I-Port interface/IO-Link

The signal flow from the controller to the valve terminal takes place via a pre-assembled or self-assembled multi-wire cable to the multi-pin plug connection, which substantially reduces installation time. The valve terminal can be equipped with up to 32 solenoid coils. This corresponds to 2 to 32 valves. The multi-pin cable should be no longer than 30 m.

#### Versions:

- Sub-D connection, 25-pin
- Sub-D connection, 44-pin

ESTO

#### Modular pneumatic components

The modular design of the MPA-C enables maximum flexibility right from the planning stage, and makes it exceptionally easy to service during operation.

The system consists of sub-bases, valves and blanking plates.

I-Port/IO-Link consists of a central master and the I-Port interface/ IO-Link devices connected via special connecting cables. This permits a decentralised layout of the devices. The connection type corresponds to a star topology. In other words, only one module or one valve terminal can be connected to each I-Port.

The I-Port interface from Festo is based on IO-Link and is compatible with IO-Link in certain areas. As well as communication, the I-Port interfaces also handle the power supply for the connected devices. The maximum length of a string is 20 m.

Versions: • Sub-D connection, 9-pin

The sub-bases form the support system for the valves. They contain the connection ducts for supplying compressed air to and venting from the valve terminal as well as the working ports for the pneumatic drives for each valve. The sub-bases are joined together via a tie rod system. This consists of a threaded rod, threaded sleeve and screw. The threaded rod/sleeve combination is selected as appropriate for the chosen number of individual bases. A valve terminal can be easily extended by adding individual sub-bases or power supply modules. This is done by inserting suitable tie rod extenders between the threaded rod and the sleeve.

Peripherals overview

#### Valve terminal pneumatics

MPA-C valve terminals with multi-pin plug connection or I-Port interface/ IO-Link can be expanded by up to 32 solenoid coils/valve positions.

Each individual sub-base is available with a valve position for valves with one or two solenoid coils.

Double solenoid valve positions can be equipped with any valve or a blanking plate.

Single solenoid valve positions can only be equipped with single solenoid valves or a blanking plate.

Key features – Pneumatic components

#### Sub-base valve

The MPA-C offers a comprehensive range of valve functions. All valves are equipped with a piston spool and patented sealing system that facilitates efficient sealing, a broad pressure range and a long service life. They have a pneumatic pilot control for optimising performance.

The air for this is supplied by means of a central pilot air supply. Sub-base valves can be replaced quickly since the tubing connections remain on the sub-base. This design is also particularly slim.

Whatever valve function is required, there are sub-base valves with one solenoid coil (monostable) or with two solenoid coils (bistable or two single solenoid valves in one housing).

#### Design

#### Valve replacement

The valves are located under the cover. The cover and each valve are mounted on the sub-base with two screws,

which means that they can be replaced easily. The sturdy mechanical structure of the cover and sub-bases ensures efficient, durable sealing.

#### Vacant positions (blanking plates) can be replaced by valves at a later date. The dimensions, mounting points and

The valve code (M, J, N, NS etc.) is located on the front of the valve, underneath the manual override, and can existing pneumatic installations rebe read through a inspection window main unchanged during this process. in the cover.

Note

Extension

A filter must be installed upstream of valves operated in vacuum mode. This prevents any foreign matter in

the intake air getting into the valve (e.g. when operating a suction cup).

Key features – Pneumatic components

#### Cover plate

#### Compressed air supply and exhausting

The valve terminal MPA-C is supplied with compressed air via:

- Right-hand end plate
- Left-hand end plate
- Power supply modules
- Sub-bases with additional power supply
- All pneumatic connections are located at the rear of the valve terminal.

Vacant position (code L) without valve function, for reserving valve positions on a valve terminal.

Exhausting (ducts 3 and 5) can take

· Sub-bases with additional power

Ducts 3 and 5 are routed completely

place using a choice of:

• Right-hand end plate

· Power supply modules

separately in the terminal.

· Left-hand end plate

supply

The valve and vacant position are located under a cover.

Using a combination of a cover and a sub-base without a valve is not permissible unless a blanking plate is also being used.

FESTO

The pilot air exhaust (duct 82/84) is completely separate from ducts 3 and 5. Its port is located in the right-hand end plate, together with the ports for the pilot air supply (12/14) and the pressure compensation port (L).

- 1 Left-hand end plate with electrical connection (multi-pin plug or I-Port interface/IO-Link) and pneumatic connections 1, 3 and 5
- 2 Sub-base with mounting holes and pneumatic connections 2 and 4
- 3 Sub-base without mounting holes and pneumatic connections 2 and 4

All valves in the valve terminal are supplied by a common pilot air source, regardless of the pressure zones that are present. The supply can take place using a choice of the following methods:

- Internal (from duct 1 on the righthand end plate) or
- External (from duct 12/14)
- 4 Power supply module with pneumatic connections 1, 3 and 5
- 5 Sub-base with additional power supply, with pneumatic connections 1, 3, 5 and 2, 4
- 6 Right-hand end plate with pneumatic connections 1, 3, 5 and L, 12/14, 82/84

## - Note

If a gradual pressure build-up in the system using a soft-start valve is chosen, an external pilot air supply should be connected so that the pilot pressure applied during switch-on is already very high.

Key features – Pneumatic components

#### Creating pressure zones and separating exhaust air

If different working pressure levels are required, the MPA-C offers a range of options for creating pressure zones. Duct 1 and/or duct 3 and/or duct 5 are blocked by inserting a separator in the sub-base. Each pressure zone must have its own supply. The following supply options are available:

- Left-hand end plate
- Right-hand end plate
- Power supply module

If you are using sub-bases with an additional power supply, each valve in the valve terminal could be operated within a separate pressure zone.

A pressure zone is created by separating the internal supply ducts using a special separator. Each pressure zone must have its own compressed air supply.

Compressed air can be supplied and exhausted via a supply module and/or the right-hand end plate.

The MPA-C allows you to select any

position for the power supply modules and the sub-bases with pressure zone separation.

The sub-bases with pressure zone separation are integrated into the terminal at the factory as specified in your order.

They can be distinguished by their coding, even when the valve terminal is assembled. Duct separation always takes place to the right of the sub-base.

#### Example: Compressed air supply and pilot air supply

External pilot air supply

The image opposite shows an example of creating and connecting an air supply in the case of an external pilot air supply.

The pilot air (duct 12/14) is supplied centrally to the entire valve terminal via the right-hand end plate. Pressure zone separation always takes place to the right of the sub-base with separator(s).

Key features – Assembly

#### Sub-base

The MPA-C is based on a modular system consisting of sub-bases and valves. The sub-bases are joined together using tie rods and thus form the support system for the valves. They contain the connection ducts for supplying compressed air to and venting from the valve terminal as well as the working ports for the pneumatic drives for each valve. The sub-bases are joined together via tie rods. The tie rod consists of a threaded rod, threaded sleeve and screw.

In principle, sub-bases have a modular structure.

The threaded rod/sleeve combination is selected according to the number and width of the individual sub-bases. To add further blocks, simply loosen the tie rod and adapt with extenders. There are no restrictions on extensions; a tie rod could be constructed almost entirely from extenders.

Each solenoid coil must be assigned to a specific pin of the multi-pin plug for the valve to be activated. Regardless of whether vacant positions or valves are used, sub-bases occupy:

- One coil/address (single solenoid valves)
- Two coils/addresses (double solenoid valves)

Sub-bases directly connected to the

right- and left-hand end plates and

every fifth sub-base within the valve

terminal must be provided with

mounting holes.

#### Valve terminal assembly

Sub-bases with threaded holes are available for the MPA-C valve terminal. Therefore, the valve terminal can be assembled either in a control cabinet or on any even surface using spacer bolts. It can be assembled in any position. However, the selected mounting position should allow dirt to be cleaned off and cleaning agent to be drained. The mounting surface must be able to support the weight of the valve terminal and any forces that arise, and must enable torsion-free assembly.

Assembly with spacer bolts

Key features – Assembly

#### Mode of operation

The tie rod for the MPA-C consists of four parts:

- Threaded rod
- Tie rod extender
- Sleeve
- Screw

This enables valve terminals of any length to be created. It takes just 4 steps to assemble the

tie rod and the valve terminal:

- Screw the sleeves to the threaded rods
- Push the rod/sleeve combination into the tie rod shafts of the subbases and push the power supply modules onto the left-hand end plate
- Screw the rod/sleeve combination onto the left-hand end plate
- Push on the right-hand end plate and secure with screws that engage into the sleeves

The tie rod enables the valve terminal to be extended at a later date. This is done by loosening the tie rod screws and disassembling the relevant components. The additional sub-base or power supply module is inserted at the required location. The previously disassembled components are then re-assembled.

To compensate for the change in length, the tie rod must be extended by the increase in length. This is done by screwing in extenders between the threaded rod and sleeve.

## 🗍 - Note

To ensure the valve terminal is properly sealed, you must:

- Check the seals between the sub-bases and replace them, if necessary, before the assembly stage during conversion work
- Tighten the tie rod screws in the correct order
- Tighten the tie rod screws to the correct torque

Key features – Assembly

#### Tie rod – Components and design

Tie rod (threaded rod)

The threaded rod is used to construct a cost-optimised fixed-grid tie rod.

Tie rod extender

The valve terminal can be extended almost infinitely using tie rod extenders. The tie rod extenders are inserted between the threaded rod and the sleeve.

Sleeve

sleeve.

The primary purpose of the sleeve is to compensate for tolerances that occur, for example, when the seals are compressed between the sub-bases during assembly.

The sleeves come in different lengths, tailored to the use of a tie rod in a fixed grid as well as generally for the individual modular tie rods.

The entire valve terminal is clamped via the tie rod using the screw. Tolerances that occur, for example when the seals are compressed between the sub-bases during assembly, are compensated for by the interaction of the screw and sleeve.

example when the seals are com-

assembly.

pressed between the sub-bases during

Tie rods can be constructed entirely using tie rod extenders. The threaded rod and sleeve are required to compensate for tolerances that occur, for

Fixed-grid tie rod with extension

Individual modular tie rod

Fixed-grid tie rod

The tie rod extenders are inserted They are available in suitable lengths between the threaded rod and the for sub-bases and supply modules.

The fixed-grid tie rod minimises assembly costs when assembling previously defined valve terminals. These valve terminals can be extended at any time.

The threaded rod (and, if applicable, the sleeve too) must be replaced if the valve terminal length is reduced.

Manual override

The manual override (MO) enables the valve to be actuated when not electrically activated or energised. The valve is switched by pushing the manual override.

#### Cover

The inspection window for the signal status display and valve designation, and the manual override mechanism, are located in the cover.

Irrespective of this, the valves below are always equipped with signal status display and manual override.

- 1 Left-hand end plate with electrical connection (multi-pin plug or I-Port interface/IO-Link)
- 2 Manual override (for each pilot solenoid coil, non-detenting)
- 3 Signal status display (for each pilot solenoid coil)
- 4 Inspection window for valve designation
- 5 Cover without manual override and without signal status display

## Note

A valve actuated manually (by means of the manual override) cannot be reset electrically. Conversely, an electrically actuated valve cannot be reset using the manual override.

#### Manual override (MO)

1 Press in the plunger of the MO using a blunt plastic pin. The pilot valve switches and actuates the main valve.

#### 2 Remove the pin.

Spring force pushes the plunger of the MO back. The pilot valve returns to its initial position and so too the single solenoid main valve (this is not the case with a double solenoid valve).

Key features – Display and operation

#### **Display and operation**

#### Labels

- The following can be used as labels:
- Laminated thermal transfer stickers
- Laser-printed stickers
- Laser printing directly onto the valve terminal surface

Labels can be applied to all sides of the valve terminal and to its individual components. The possible size of the labelling surfaces can be taken from the dimensional drawing ( $\rightarrow$  30). It is not possible to label the valves located beneath covers in addition to the information printed on by the manufacturer. The valve positions are therefore labelled on the covers or on the sub-bases

## - Note

When applying labels, the requirements in terms of cleaning and environmental emissions must be observed, especially for stuck-on labels.

Key features – Electrical components

#### Electrical power as a result of current reduction

Each solenoid coil is protected with a spark arresting protective circuit as well as against polarity reversal. All valve types are additionally equipped with integrated current reduction. MPA-C valves are supplied with operating voltage in the range 21.6 ...  $26.4 \vee (24 \vee +/-10\%)$ .

#### Electrical connection - Left-hand end plate

The electrical connection from the valves to the higher-order controller is in the left-hand end plate. Switching between the various connection options is easy: simply swap the left-hand end plate; the pneumatic interlinking remains as is. The valves are switched by means of positive or negative logic (PNP or NPN). Mixed operation is not permitted.

#### Guidelines on addressing for valves/solenoid coils

The numbering of the addresses goes from left to right in ascending consecutive order. The following applies at the individual valve positions: address x for coil 14 and address x+1 for coil 12. Each sub-base occupies a defined number of addresses/pins: • For 1 solenoid coil: 1

• For 2 solenoid coils: 2

If a single solenoid valve is assembled on a double solenoid valve position, the second address (for coil 12) is also occupied and cannot be used.

Key features – Electrical components

#### I-Port interface/IO-Link

The I-Port interface/IO-Link enables the MPA-C valve terminal to be connected to the following systems:

- I-Port master from Festo (CPX terminal, CECC)
- Fieldbus node CTEU from Festo

#### • IO-Link master

The maximum distance between the I-Port/IO-Link master and valve terminal with I-Port interface/IO-Link is 20 m. The 5-pin connecting cables contain the power supply for the valves; separate from this is the power supply for the internal valve terminal electronics and the control signals.

Key features – Electrical components

#### Instructions for use

#### Equipment

Operate system equipment with unlubricated compressed air if possible. Festo valves and cylinders are designed so that, if used as intended, they will not require additional lubrication and will still achieve a long service life.

The quality of compressed air downstream of the compressor must correspond to that of unlubricated compressed air. If possible, do not operate all of your system equipment with lubricated compressed air. The lubricators should, where possible, always be installed directly upstream of the actuator used. Incorrect additional oil and too high an oil content in the compressed air reduce the service life of the valve terminal.

Use Festo special oil OFSW-32 or the alternatives listed in the Festo catalogue (as specified in DIN 51524 HLP32; basic oil viscosity 32 CST at 40 °C).

#### Bio-oils

When using bio-oils (oils which are based on synthetic or native ester, e.g. rapeseed oil methyl ester), the maximum residual oil content of 0.1 mg/  $m^3$  must not be exceeded (see ISO 8573-1 Class 2).

#### Mineral oils

When using mineral oils (e.g. HLP oils to DIN 51524, parts 1 to 3) or similar oils based on poly-alpha-olefins (PAO), the maximum residual oil content of 5 mg/m<sup>3</sup> must not be exceeded (see ISO 8573-1 Class 4). A higher residual oil content irrespective of the compressor oil cannot be permitted, as the basic lubricant would be flushed out over time.

Technical data

Note on forced checking procedure	Nin. 1/week							
CE marking (see declaration of conformity)	To EU EMC Directive <sup>1)</sup>							
Maximum positive test pulse [µs]	400							
with 0 signal								
Maximum negative test pulse [µs]	200							
with 1 signal								
Shock resistance	Shock test with severity level 2 to FN 942017-5 and EN 60068-2-27							
Vibration resistance	Transport application test with severity level 2 to FN 942017-4 and EN 60068-2-6							

1) For information about the applicability of the component see the manufacturer's EC declaration of conformity at: www.festo.com/sp → User documentation. If the component is subject to restrictions on usage in residential, office or commercial environments or small businesses, further measures to reduce the emitted interference may be necessary.
