Fieldbus modules CTEU/Installation system CTEL

FESTO

Fieldbus modules CTEU/Installation system CTEL

Key features

The system

- CTEU fieldbus modules for valve terminals
- Festo-specific interface (I-Port)
- Input modules CTSL for detecting sensor signals
- Connection for the installation system CPI from Festo
- Direct and easy networking of valve terminals and other devices via a bus connection
- Wide range of applications thanks to high degree of protection to IP65/67
- Universal connection technology (Sub-D, M12, terminal strip)
- Optional decentralised installation of bus node for connecting two valve terminals
- Basic diagnostics: undervoltage, short circuit

CTEU for the universal use of valve terminals. The Festo-specific, uniformly defined interface (I-Port) enables the fieldbus modules to be used for different types of valve terminal.

The following protocols are currently supported:

- CANopen
- DeviceNet
- CC-LINK
- PROFIBUS
- EtherCAT
- AS-Interface
- PROFINET
- EtherNet/IP

Valve terminal configurator

Online via: ➔ www.festo.com

A valve terminal configurator is available online to help you select a suitable valve terminal.
Select the valve terminal with I-Port interface and order the associated CTEU bus nodes. The bus nodes then only need to be placed on the valve terminal.
The ident. code for the valve terminals specifies the valve functions, the number of valves and unused valve positions, as well as the additional functions and the type of compressed air supply.
As is the case with all Festo products, all valve terminals are supplied:

- Fully preassembled
- Equipped with fittings on request
- Tested for electrical function
- Tested for pneumatic function
- Securely packaged
- User documentation can be downloaded free of charge

Fieldbus modules CTEU/Installation system CTEL

Key features

Fieldbus systems with CTEU

CANopen
CANopen was originally developed for the automotive industry by a joint venture led by Bosch. It has been maintained by the organisation CiA (CAN in Automation) since 1995, and at the end of 2002 it was standardised as European standard EN 50325-4.

DeviceNet
DeviceNet is an open fieldbus standard that was developed by Rockwell Automation on the basis of the CAN protocol.
DeviceNet is standardised in European standard EN 50325.

CC-Link
"Control and Communications Link" (CC-Link) was developed by Mitsubishi Electric and has been available as an open fieldbus network since 1999.

PROFIBUS
Process Fieldbus (PROFIBUS) is a fieldbus that was developed by Siemens and has been standardised in the IEC 61158 series of international standards. It enables communication between devices without the need for any specific adaptations to the interface.

EtherCAT
EtherCAT is a bus with real-time capability; it was developed by Beckhoff and the EtherCAT Technology Group (ETG). EtherCAT is an open technology and has been standardised in international standards IEC 61158 and IEC 61784 and in ISO 15745-4.

AS-Interface
AS-Interface is a manufacturer-independent, easy and robust installation system. It was developed and represented by the AS-International Association, a loose association of diverse companies from different sectors.
AS-Interface has been standardised by IEC 62026-2 and EN 50295.

PROFINET
PROFINET by PROFIBUS and PROFINET International (PI) is the open industrial Ethernet standard for automation and is based on Ethernet TCP/IP and IT standards. PROFINET technology is developed by Siemens and the PROFIBUS user organisation.
PROFINET is standardised in IEC 61158 and IEC 61784.

EtherNet/IP
EtherNet/IP was developed by Allen-Bradley (Rockwell Automation) and the ODVA (Open DeviceNet Vendor Association). EtherNet/IP is an open standard (technology based on Ethernet TCP/IT and UDP/IP) for industrial networks and is standardised in the IEC 61158 series of international standards.

Fieldbus modules CTEU/Installation system CTEL

Key features

Integration of the I-Port interface/IO-Link

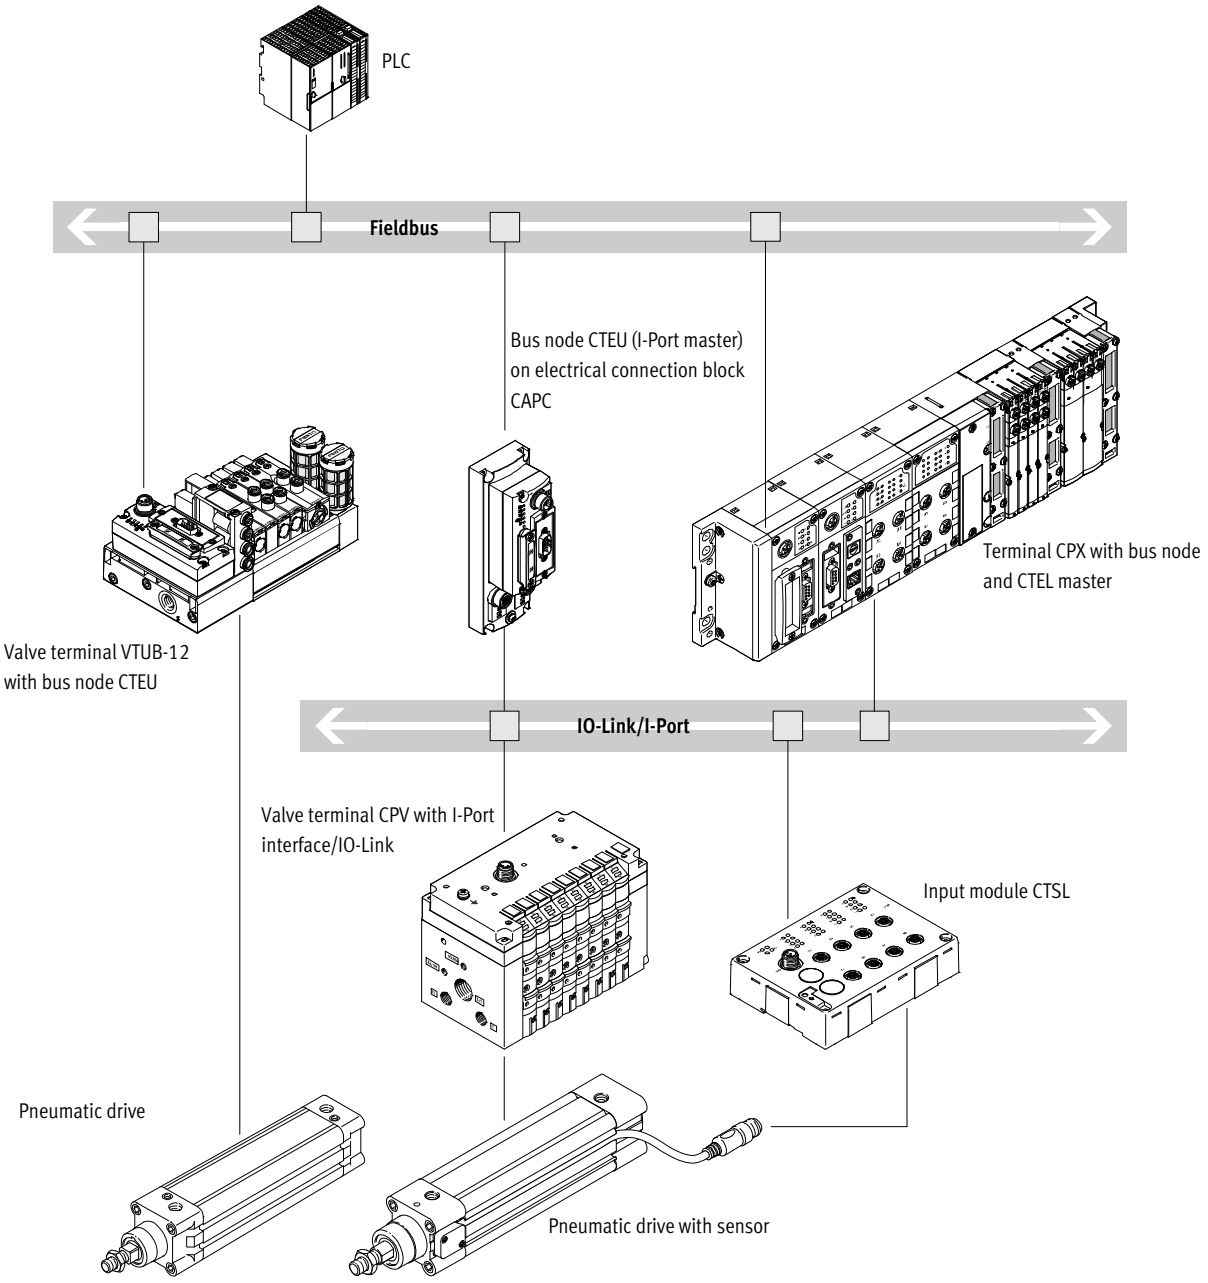
Different bus nodes are used for integration in the control systems of various manufacturers.

The following protocols are supported with the compatible bus node CTEU:

- CANopen
- DeviceNet
- EtherCAT
- CC-LINK
- PROFIBUS
- AS-Interface
- PROFINET
- EtherNet/IP

A second valve terminal can be connected via a connecting plate (decentralised adapter). (➔p.6)

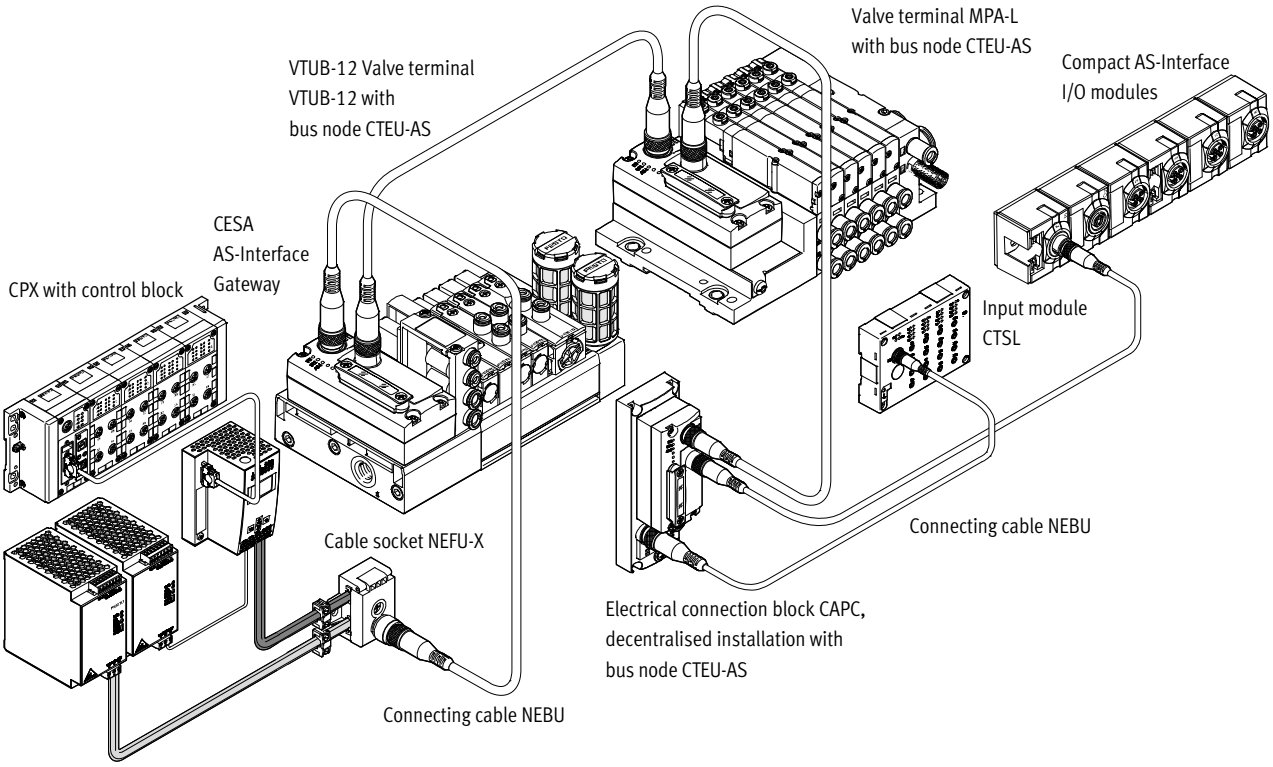
System overview, example



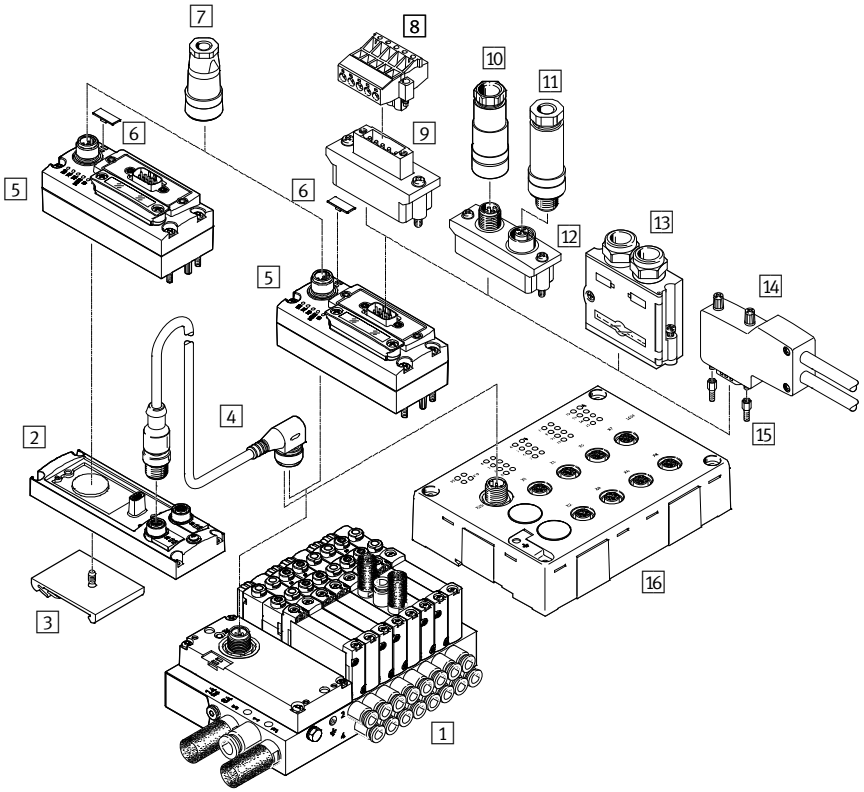
- Communication with the higher-order controller via fieldbus
- Use a bus node CTEU compatible with the fieldbus protocol
- Up to 64 inputs/outputs (solenoid coils), depending on the valve terminal

System overview

Example CTEU-AS interface



Overview of CTEU with valve terminal VTUG



Accessories				
		Type	Brief description	➔ Page/Internet
1	Manifold rail	VABM	With I-Port interface, for connecting max. 35 valves	vtug
2	Electrical connection block	CAPC	For connecting a further terminal (2x I-Port interface)	13
3	H-rail adapter	CAFM	For electrical connection block CAPC	13
4	Connecting cable	NEBU	For IO-Link	11, 13
5	Bus node	CTEU	–	15, 19, 25, 29, 34, 38, 41, 45, 49
6	Inscription label	ASLR	For bus node	aslr
7	Power supply socket	NTSD/FBSD	For power supply	18, 23, 28, 33, 37, 44
8	Terminal strip	FBSD-KL	For Open Style connection	18, 23
9	Bus connection	FBA-1	Open Style for 5-pin terminal strip	18, 23
10	Fieldbus socket	FBSD-GD, NECU	For Micro Style connection, M12, 5-pin	18, 23, 33
11	Plug connector	FBS, NECU	For Micro Style connection, M12, 5-pin	18, 23, 33
12	Bus connection	FBA-2	Micro Style, 2xM12, 5-pin	18, 23, 33
13	Plug connector	FBS-SUB-9-BU	Sub-D	18, 23, 33
14	Plug connector	FBS-SUB-9-WS	Sub-D, angled	18, 33

System diagnostics CTEU

Diagnostics LED on the bus node CTEU

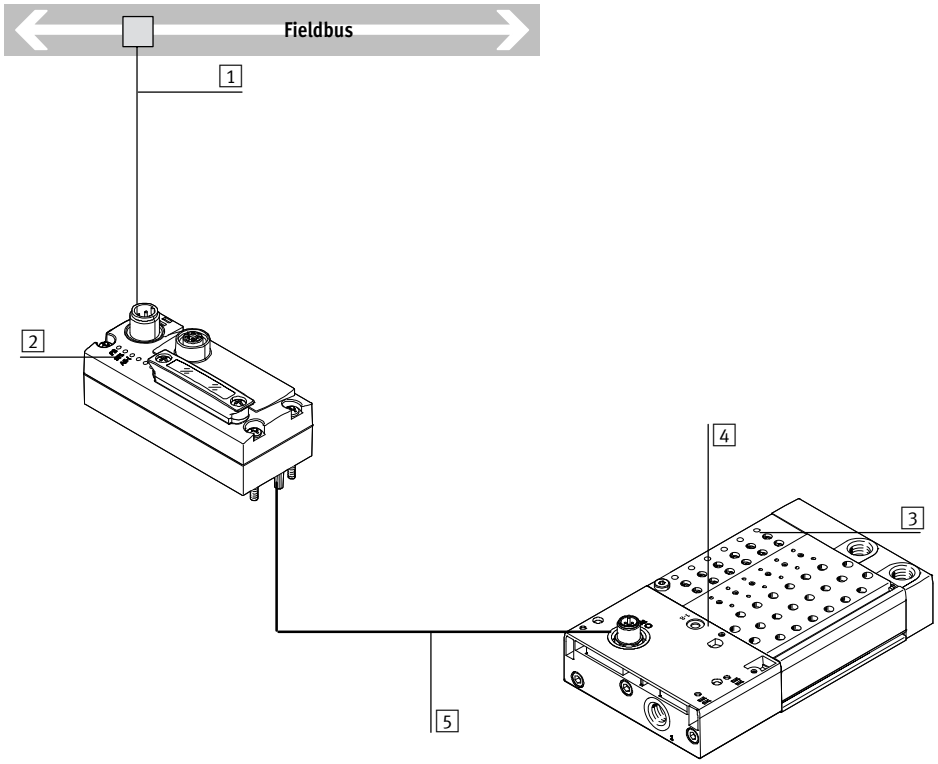
The fieldbus-specific LEDs indicate the communication status and the fieldbus function.

A further LED indicates the status of the power supply:

- Undervoltage/short circuit
- Power supply ensured
- Interruption of voltage

Diagnostic messages via the fieldbus

- Configuration error
- Short circuit/overload of an output module
- Short circuit/undervoltage
- Undervoltage/load voltage of the valves



1 Diagnostics via fieldbus
2 Bus-specific LEDs
3 Switching status display using LEDs (one per valve on the manifold rail)
4 Additional communication and voltage status LED for decentralised installation
5 I-Port interface to the fieldbus module

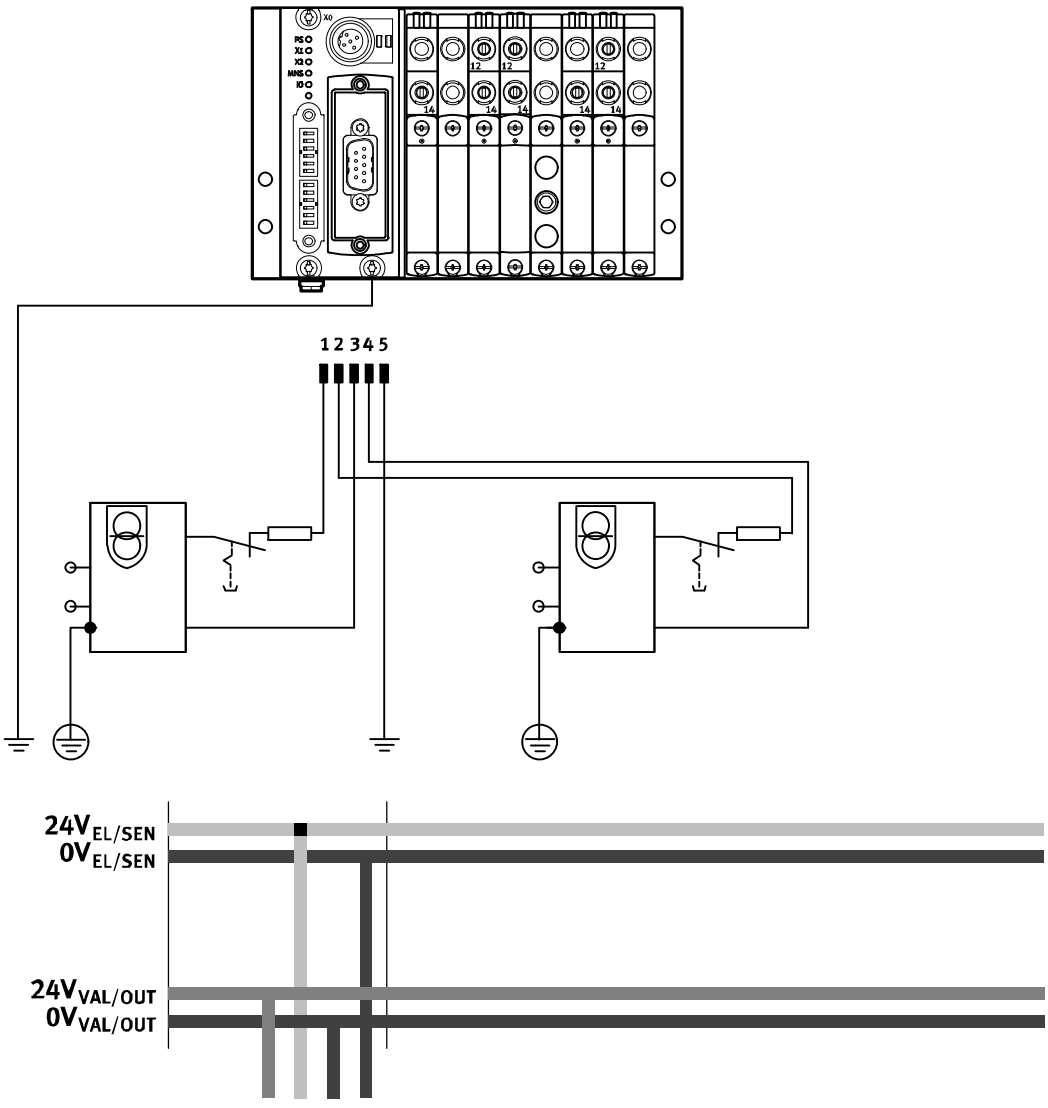
Operating voltage and load current supply

The operating voltages for the valve terminal with I-Port interface are centrally connected to the bus node via a 5-pin M12 plug connector.

The operating voltages are required for the bus node electronics and the load supply to the valves (supplied separately from the electronics supply).

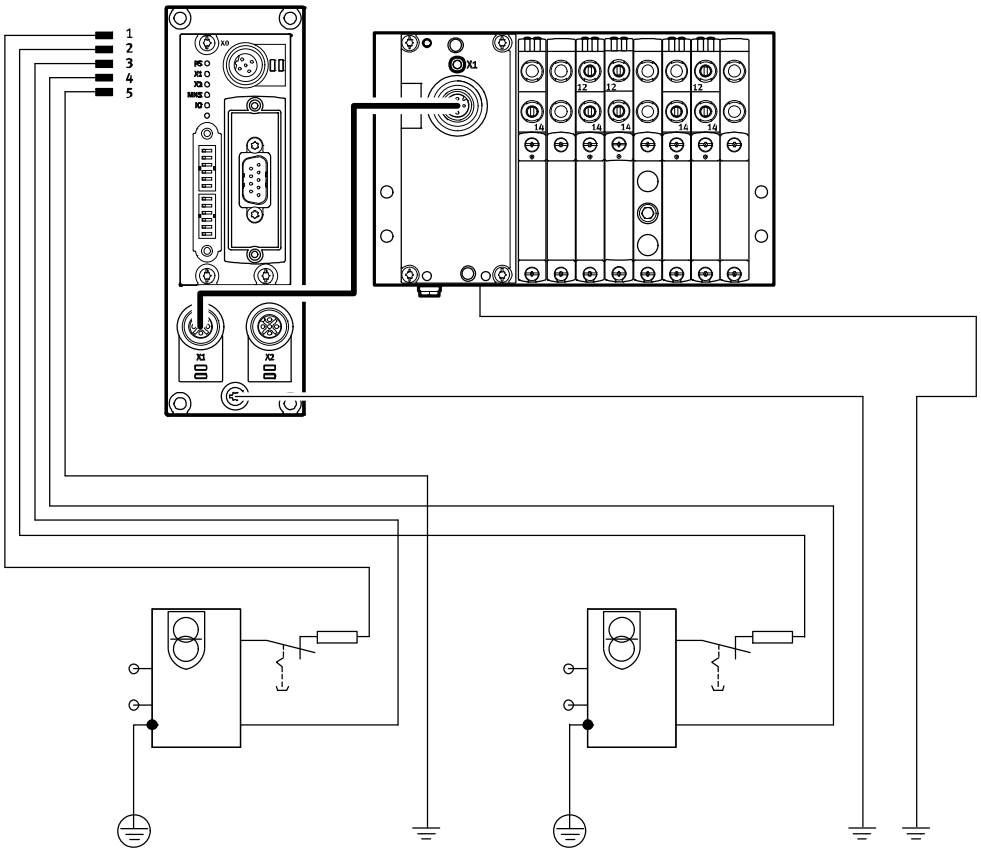
The power supplies do not have a common 0V line and are thus completely galvanically isolated from one another.

Example power supply concept CTEU with valve terminal VTUG



Power supply concept

Example power supply concept CTEU with electrical connection block (decentralised adapter) CAPC and valve terminal VTUG



Festo-specific, standardised interface for direct connection to the fieldbus by mounting the bus node CTEU or to an IO-Link master via a cable (in IO-Link mode).

I-Port interface/IO-Link

Versions:
- I-Port interface for bus nodes (CTEU)
- IO-Link mode for direct connection to a higher-order IO-Link master

The electrical supply/transmission of communication takes place via an M12 plug connector.

General technical data

Communication types			IO-Link
Electrical connection			• M12 plug connector, 5-pin • A-coded • Metal thread for screening

Fieldbus modules CTEU/Installation system CTEL

Technical data – Electrical connection block CAPC

Function

The electrical connection block CAPC enables decentralised installation of bus nodes CTEU on a valve terminal or input modules with I-Port interface.

Scope of application

- M12 connection technology (two interfaces)
- Enables the installation of valve terminals or other devices over a distance of 20 metres
- By using the accessory CAFM the electrical connection block can be installed on an H-rail

The bus node handles communication between the valve terminal and a higher-level CANopen® master.

The module has basic diagnostic functions. It has 5 integrated LEDs for on-site display. A maximum of 8 byte inputs and 8 byte outputs are transmitted in the cyclic process image.

Application

Fieldbus connection

The bus connection is established via a 9-pin Sub-D plug connector (pin) as per the CAN in Automation (CiA) specification DS 102 with additional 24 V CAN transceiver supply (option as per DS 102).

The bus connector plug (with IP65/IP67 degree of protection from Festo or IP20 degree of protection from other manufacturers) facilitates the connection of an incoming and an outgoing bus cable.

There are 4 contacts each available for the conductors (CAN_L/CAN_H and 24 V/0 V optional) of the incoming and outgoing bus cables.

The fieldbus parameters and the basic device parameter settings are set on the bus node via DIL switches.

Implementation

Protocol chip used:
- CAN transceiver 82C251

Possible transmission rate:
- 125 kbps
- 250 kbps
- 500 kbps
- 1 Mbps

Max. CANopen cable length (trunk cable):
- 40 m at 1 Mbps
- 100 m at 500 kbps
- 250 m at 250 kbps
- 500 m at 125 kbps

Max. branch cable length (drop cable):
- 0.30 m at 1 Mbps
- 0.75 m at 500 kbps
- 2.00 m at 250 kbps
- 3.75 m at 125 kbps

The following variants can be realised using an adapter:
- 2 x Micro Style M12, degree of protection IP65, 5-pin, plug connector and socket
- Open Style plug connector, degree of protection IP20, 5-pin, pin

The bus node handles communication between the valve terminal and a higher-order DeviceNet® master.

The module has basic diagnostic functions. It has 5 integrated LEDs for on-site display. Up to 8 byte inputs and 8 byte outputs are typically transmitted in the cyclic process image.

Application

Fieldbus connection

The bus connection is established via a 9-pin Sub-D socket with a typical allocation (to EN 50170).

The bus connector plug (with degree of protection IP65/IP67 from Festo or IP20 from other manufacturers) facilitates the connection of an incoming and an outgoing bus cable.

The fieldbus parameters and the basic device parameter settings are set on the bus node via DIL switches.

Implementation

The bus node handles communication between the valve terminal and a higher-order master for Control & Communication Link (CC-Link®).

The module has basic diagnostic functions. It has 5 integrated LEDs for on-site display. A maximum of 8 byte inputs and 8 byte outputs are transmitted in the cyclic process image.

Application

Fieldbus connection

The bus connection is established by means of a screw terminal with IP20 degree of protection, a 9-pin Sub-D plug connector with IP65/IP67 degree of protection from Festo or a Sub-D plug connector with IP20 degree of protection from other manufacturers.

The module has a system and load supply, a fieldbus connection and a connection to the valve terminal with serial I-Port interface.

Both connection types have the function of an integrated T-distributor and thus support the connection of an incoming and outgoing bus cable.

The integrated interface with RS485 transmission technology is designed for the typical CC-Link 3-wire connection technology (in accordance with CLPA CC-Link Spec. V1.1).

Implementation

Protocol chip used:
- MFP3 from Mitsubishi

Maximum CC-Link cable length (minimum 0.2 m between devices):
- 100 m at 10 Mbps
- 150 m at 5 Mbps
- 200 m at 2.5 Mbps
- 600 m at 625 kbps
- 1200 m at 156 kbps

When using branch lines: maximum branch line length 8 m, maximum 6 stations per branch line
Length of main string:
- 100 m at 625 kbps, total length of branch line 50 m
- 500 m at 156 kbps, total length of branch line 200 m

Higher baud rates not permitted with a branch line.

The following variants can be realised using an adapter:
- Spring-loaded terminal In/Out with IP65 degree of protection (adapter 532220)
- Screw-in clamping connector with IP20 degree of protection (adapter 197962)

The bus node handles communication between the valve terminal and a higher-order master for PROFIBUS DP®.

The module has basic diagnostic functions. It has 4 integrated LEDs for on-site display. A maximum of 8 byte inputs and 8 byte outputs are transmitted in the cyclic process image.

Application

Fieldbus connection

The bus connection is established via a 9-pin Sub-D socket with a typical PROFIBUS allocation (to EN 50170).

The bus connector plug (with IP65/IP67 degree of protection from Festo or IP20 degree of protection from other manufacturers) facilitates the connection of an incoming and an outgoing bus cable.

An active bus terminal can be connected using the DIL switch integrated in the plug connector.

The Sub-D interface is designed for controlling network components with a fibre-optic cable connection.

Transmission rate/overview of cable lengths

The bus node handles communication between the valve terminal and a higher-order master for EtherCAT®.

The module has basic diagnostic functions.
It has 6 integrated status LEDs for on-site display.
A maximum of 16 byte inputs and 16 byte outputs are transmitted in the cyclic process image.

Application

Fieldbus connection

The bus connection is established via two M12 sockets, D-coded to IEC61076-2-101 with degree of protection IP65/IP67.
Both connections are equivalent 100BaseTX Ethernet ports with integrated auto MDI functionality (crossover and patch cables can be used) that are brought together via an internal switch.

The module has a system and load supply, a fieldbus connection and a connection to the valve terminal with serial I-Port interface.

Please observe the applicable specifications such as the cable specifications for Ethernet networks ISO/IEC11801 and ANSI/TIA/EIA-568-B.

- Maximum cable length (between network stations): 100 m
- Transmission rate: 100 Mbps
- EtherCAT communication chip: ASIC ET1100

EtherCAT bus node

The EtherCAT bus node supports the EtherCAT protocol based on the Ethernet standard and TCP/IP technology to IEEE802.3.
This guarantees a data exchange with a high data transmission rate, for example I/O data from sensors, actuators or robot controllers, PLCs or process equipment. Furthermore, non real-time critical information such as diagnostic information, configuration information, etc. can be transferred.
The data bandwidth is sufficient to transmit both data types (real-time and non-real-time) in parallel.

The bus node has a system and load supply, EtherCAT input and output port, LEDs for status and diagnostic messages and DIL switch elements.
Diagnostics is possible directly at the bus node and/or via fieldbus.
The bus node has separate operating and load voltage supplies.
The bus node is mounted on an I-Port compatible device (e.g. valve terminal or connecting block) from Festo.

The bus node supplies voltage to downstream devices connected by means of the I-Port interface.

The following can be set via DIL switch:
- Station addresses
- Diagnostics on/off
- Fail state behaviour

The bus node handles communication between the valve terminal and a higher-order AS-Interface® master.

- Activation of up to 16 solenoid coils per valve terminal
- Automatic addressing
- Automatic detection of the number of connected valves

Properties

The module has a system and load supply, a bus connection and a connection to the valve terminal with serial I-Port interface.

The module has basic diagnostic functions. It has 3 integrated LEDs for on-site display.

A maximum of 2 byte inputs and 2 byte outputs are transmitted in the cyclic process image.

Fieldbus modules CTEU/Installation system CTEL

Technical data – CTEU-PN

The bus node handles communication between the valve terminal and a higher-order PROFINET® master.

The module has basic diagnostic functions. It has 6 integrated LEDs for on-site display. A maximum of 64 byte inputs and 64 byte outputs are transmitted in the cyclic process image.

Application			
Fieldbus connection			
The bus connection is established via two M12 sockets, D-coded to IEC61076-2-101 with degree of protection IP65, IP67.	Both connections are equivalent 100BaseTX Ethernet ports (as per IEEE 802.3).	There is also an integrated switch function that enables free selection of the ports TP1/TP2 for PROFINET communication.	The voltage for the CTEU-PN bus node is supplied via an M12 plug connector, 5-pin, A-coded.
I-port interface			
The bus node supports two interfaces for connecting I-Port devices.	When mounting the bus node on a valve terminal (direct integration) only one interface is used.	When using the CTEU-PN bus node on the electrical connection block CAPC (installation system CTEL)	both interfaces are available via the connecting plate.

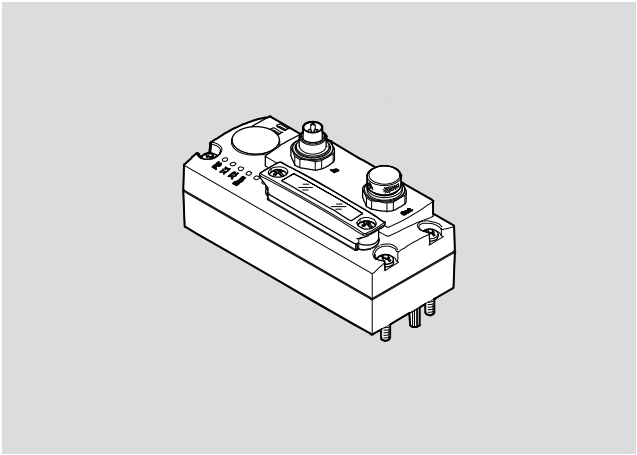
CPI interface for integrating components with I-Port interface into the installation system CPI from Festo.

The module has basic diagnostic functions. It has 4 integrated LEDs for on-site display. A maximum of 4 byte inputs and 4 byte outputs are transmitted in the cyclic process image.



Application			
Fieldbus connection/power supply			
In the CPI system, the power supply and the communication signal are routed via a common port.	The bus node additionally has an M9 plug connector for connection to the signal coming from the CPI master and an M9 socket for transmitting the signal to other CPI modules.	The series connection of CPI modules (string) can contain a maximum of 4 modules with CPI functionality. The number of outputs/inputs per string is limited to 32 of each.	The maximum length of a string is 10 m.
I-port interface			
The bus node supports two interfaces for connecting I-Port devices.	When mounting the bus node on a valve terminal (direct integration) only one interface is used.	When using the bus node CTEU-CP on the electrical connection block CAPC (installation system CTEL), both interfaces are available via the connection plate.	The total number of inputs/outputs that can be connected is limited by the overall configuration of the CP string.

Fieldbus modules CTEU/Installation system CTEL

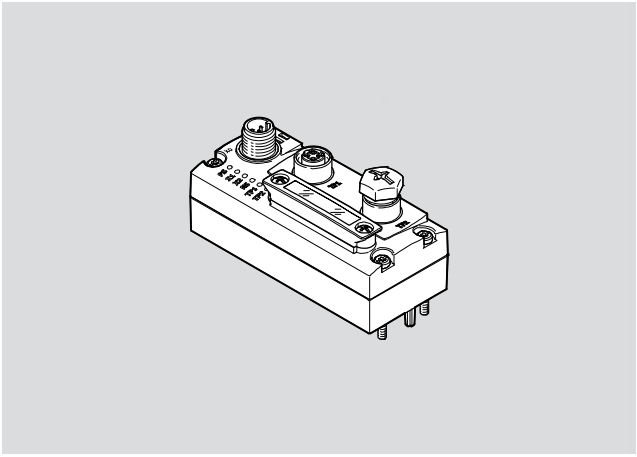
Technical data – CTEU-EP

The bus node handles communication between the valve terminal and a higher-order master via Ethernet.

The module has basic diagnostic functions. It has 6 integrated LEDs for on-site display. A maximum of 64 byte inputs and 64 byte outputs are transmitted in the cyclic process image.



Application

The bus node CTEU-EP is a module within the CTEU series which can be used to connect I-Port devices with specification V1.0 to an EtherNet/IP or Modbus/TCP bus.
Depending on the installation, the bus node provides two I-Port interfaces for the connection of I-Port devices.

Installation

Direct integration

- Mounting the bus node on an I-Port device, e.g. valve terminal
- One I-Port interface available (for internal communication)

CAPC adapter

- Mounting the bus node on the adapter
- Two I-Port interfaces available on the adapter

Power supply

Power is supplied to the bus node and the connected I-Port devices by means of an M12 plug connector, 5-pin, A-coded, on the top side of the housing.

Ethernet connection

The bus node CTEU-EP provides two 100BASE-TX Ethernet interfaces (to IEEE802.3) electrically isolated from the rest of the internal electronics. The integrated switch function differentiates automatically between the incoming and outgoing Ethernet connection, regardless of the network connection used.

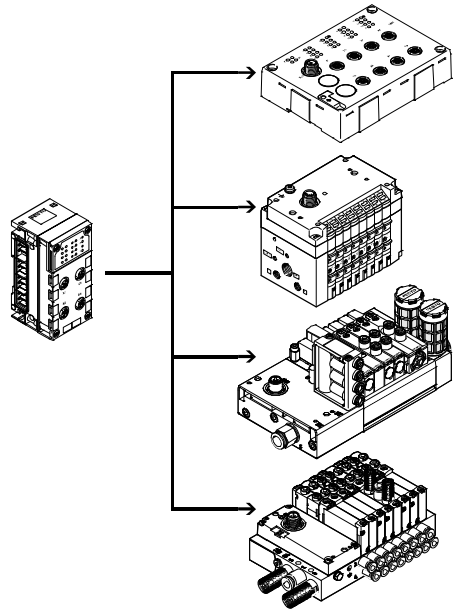
The electrical interface CPX-CTEL master establishes the connection to modules of the CTEL/CTEU series that have an I-Port interface (device). The I/O data from the connected devices are transmitted to the connected CPX bus node and thus to the higher-order controller via fieldbus.
A maximum of 4 devices can be connected to a CPX CTEL Master via corresponding M12 interfaces.

Application

I-Port interface

As well as transmitting the communication data, the I-Port interfaces of a CPX-CTEL master also transmit the power supply to the connected sensors and the load supply to the valves (or outputs). Both circuits are supplied separately with 24 V, using a separate reference potential.
The connecting cables used must meet the enhanced requirements resulting from the dual function of signal cable and supply cable.

Configuration example – CPX-CTEL master with CTEL modules



The CPX-CTEL master provides 4 external I-Port interfaces, each of which can be connected with a device. I-Port is an interface for exchanging serial data for connecting decentralised modules or valve terminals from Festo. The I-Port interface is based on IO-Link and is compatible with it in certain areas. The connection type corresponds to a star topology. In other words, only one module or valve terminal can be connected to each I-Port.

The restrictions compared to IO-Link include:

- Permanently set baud rate of 230.4 kbps
- SIO mode is not supported
- Max. 32 bytes of input data and 32 bytes of output data
- Only one dump of the master commands is used
- Festo plug & work principle, configuration via IODD is not supported.

Implementation

The CPX-CTEL master from Festo enables modules with an I-Port interface to be connected to a CPX system:
- A maximum of 4 devices with individual electronic fuse protection
- A maximum of 64 inputs/ 64 outputs per I-Port interface
- The maximum length of a string is 20 m

The following device variants are available:
- Input modules with 16 digital inputs (connection technology M8 3-pin and M12 5-pin)
- Valve terminals with I-Port interface (up to 48 solenoid coils, different valve functions)

The decentralised arrangement of the modules and valve terminals with I-Port enables them to be mounted close to the cylinders and actuators or sensors to be controlled. This means that the compressed air supply lines and sensor cables used can be shortened, and it may be possible to use smaller valves, thereby saving costs.

Several CPX-CTEL masters can be combined in one CPX terminal, depending on the address capacity of the bus node.
Example:
- CPX-FB13 (512 I/O)
- A maximum of 2 CPX-CTEL masters is possible (each with 256 E/A)

Configuration

Settings

The precise number of the I/O bytes made available depends on the requirements of the connected devices or of the suitable selected operating mode.
The operating mode or preset configuration of the CPX-CTEL master can be specified by the user.
DIL switches are used for selecting the operating mode and setting the manual configuration. These DIL switches are not required during continuous operation and are only accessible in the disassembled state.

Manual configuration

In the case of manual configuration (tool change mode), the volume of inputs and outputs in the process image of the CPX system or of the higher-level fieldbus can be defined manually using the DIL switches.

The process image then always has the same scope, regardless of the connected devices.
The I/O length specified always applies to all four I-Ports (max. 8 bytes per I-Port).

Automatic configuration

In the case of automatic configuration, the I/O length for each I-Port is determined individually and this value is used to select the appropriate or next highest configuration preset.

Power supply for I-Port devices

The CPX-CTEL master provides two separate power supplies for the connected devices:
- For operating the device and the inputs connected to it
- For the outputs and valves that are connected to the device

The power supply for the devices and the inputs is provided by the power supply for the electronics and sensors of the CPX terminal.
The power supply for the outputs and valves is provided by the power supply for the valves of the CPX terminal.
The interlinking block with additional power supply ensures a separate voltage supply for the valves and outputs. This allows the supply voltage to be disconnected separately.
The valves and outputs of the connected I-Port devices can therefore be disconnected separately without disconnecting the devices.

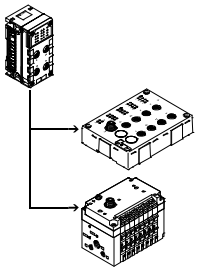
Fieldbus modules CTEU/Installation system CTEL

Technical data – Interface CPX-CTEL-2



The electrical interface CPX-CTEL master establishes the connection to modules of the CTEL/CTEU series that have an I-Port interface (device). The I/O data from the connected devices are transmitted to the connected CPX bus node and thus to the higher-order controller via fieldbus.
A maximum of two IO-Link devices can be connected to an electrical interface CPX-CTEL-2-... via corresponding M12 interfaces.

Application

IO-Link interface

The communication system IO-Link is used to exchange serial data from decentralised function modules (devices) at the field level.
The electrical interface CPX-CTEL-2-... provides two IO-Link interfaces, each of which can be connected with a device.
The connection type corresponds to a star topology, which means that only one device can be connected to each port.
The address space that the module makes available and assigns accordingly in the CPX system can be configured according to various presettings.
Selection of the operating mode and the setting for manual configuration takes place via the DIL switches.
These DIL switches are not required during continuous operation and are only accessible in the disassembled state.

Restrictions

The interfaces (ports) of electrical interface CPX-CTEL-2-... support the connection of IO-Link devices with few limitations.

- The process data length of the inputs and outputs is limited to 16 bytes per port for inputs and outputs
- The driver strength on the C/Q line is limited to 250 mA
- SIO mode is not supported

Power supply for devices

The electrical interface CPX-CTEL-2-... provides two separate power supplies for the connected devices:

- For the operation of the device and the inputs connected to it
- For the outputs and valves that are connected to the device

The power supply for the devices and the inputs is provided by the power supply for the electronics and sensors of the CPX terminal.
The power supply for the outputs and valves is provided by the power supply for the valves of the CPX terminal.
The interlinking block with additional power supply ensures a separate voltage supply for the valves and outputs. This allows the supply voltage to be disconnected separately.
The valves and outputs of the connected I-Port devices can therefore be disconnected separately without disconnecting the devices.

Technical data – Interface CPX-CTEL-2

General technical data			
Type			CPX-CTEL-2-M12-5POL-LK
Protocol			IO-Link, master version V 1.0
Max. address capacity	Outputs	[bit]	256
	Inputs	[bit]	256
I-Port connection			2x socket M12, 5-pin, A-coded
Number of IO-Link interfaces			2
Max. cable length		[m]	20
Internal cycle time		[ms]	1 per 8 bits of user data
Electrical isolation	Channel – channel		No
	Channel – internal bus		Yes, using an intermediate supply
LED displays			X1 … 2 = status of the IO-Link interface 1 … 2 PS = Electronic supply PL = Load supply ↯ = Module error
Diagnostics			• Communication error • Short circuit module • Module-oriented diagnostics • Undervoltage
Parameterisation			• Diagnostic behaviour • Fail-safe mode per channel • Forcing per channel • Idle mode per channel • Module parameters
Additional functions			–
Control elements			DIL switches
Operating voltage	Nominal value	[V DC]	24 (polarity-safe)
	Permissible range	[V DC]	18 … 30
	Power failure buffering	[ms]	10
Intrinsic current consumption at nominal operating voltage		[mA]	Typically 65
Max. power supply per channel		[A]	2x 1.6
Max. residual current of outputs per channel		[A]	2x 1.6
Degree of protection to EN 60529			IP65, IP67
Temperature range	Operation	[°C]	–5 … +50
	Storage/transport	[°C]	–20 … +70
Materials			PA reinforced, PC
Note on materials			RoHS compliant
Grid dimension		[mm]	50
Dimensions (incl. interlinking block) W x L x H		[mm]	50 x 107 x 55
Product weight		[g]	110

Note

Please observe the general limits and guidelines for the system when configuring the electrical modules.

- Voltage
  24 V DC

I-Port interface for communication between a valve terminal CPV and an I-Port master. It activates a valve terminal CPV with up to 16 solenoid coils on max. 8 valve positions.
The connection to a higher-order controller can be achieved by:

- Connection to an I-Port master from Festo (CPX-CTEL)
- Direct mounting of a bus node CTEU
- Connection to an IO-Link master (in IO-Link mode)

Fieldbus modules CTEU/Installation system CTEL

Technical data – Input modules CTSL

Function

Digital input modules facilitate the connection of proximity sensors or other 24 V DC sensors (inductive, capacitive, etc.).

Plug connectors with double allocation are separated using a DUO plug connector or DUO cable.

Application

- Input modules for 24 V DC sensor signals
- M12 connection technology
- Display of the input statuses for each input signal via an assigned LED
- Operating voltage supply 24 V DC for all connected sensors
- Diagnostic LED for short circuit/ overload of sensor supply
- Labelling options on all sides with large, hinged inscription label
- Earthing plate and H-rail mounting already integrated

Product Range and Company Overview

A Complete Suite and Company Overview

Our experienced engineers provide complete support at every stage of your development process, including: conceptualization, analysis, engineering, design, assembly, documentation, validation, and production.

Custom Automation Components
Complete custom engineered solutions

Custom Control Cabinets
Comprehensive engineering support and on-site services

Complete Systems
Shipment, stocking and storage services

The Broadest Range of Automation Components

With a comprehensive line of more than 30,000 automation components, Festo is capable of solving the most complex automation requirements.

Electromechanical
Electromechanical actuators, motors, controllers & drivers

Pneumatics
Pneumatic linear and rotary actuators, valves, and air supply

PLCs and I/O Devices
PLC's, operator interfaces, sensors and I/O devices

Supporting Advanced Automation... As No One Else Can!
Festo is a leading global manufacturer of pneumatic and electromechanical systems, components and controls for industrial automation, with more than 16,000 employees in 60 national headquarters serving more than 180 countries. For more than 80 years, Festo has continuously elevated the state of manufacturing with innovations and optimized motion control solutions that deliver higher performing, more profitable automated manufacturing and processing equipment. Our dedication to the advancement of automation extends beyond technology to the education and development of current and future automation and robotics designers with simulation tools, teaching programs, and on-site services.

Quality Assurance, ISO 9001 and ISO 14001 Certifications
Festo Corporation is committed to supply all Festo products and services that will meet or exceed our customers' requirements in product quality, delivery, customer service and satisfaction.

To meet this commitment, we strive to ensure a consistent, integrated, and systematic approach to management that will meet or exceed the requirements of the ISO 9001 standard for Quality Management and the ISO 14001 standard for Environmental Management.
