FESTO

Key features

Mode of operation

The camera not only contains the sensor system for image data acquisition, but also the complete electronic evaluation unit for image processing, an integrated PLC and the interfaces for communication with higher-level controllers. The CheckKon and CheckOpti software tools make configuring the image processing task very straightforward.

The user creates reference images with the camera by presenting different sample parts and then defines the desired inspection criteria. These can include, for example, brightness, distance, angle and circularity, but also the reading of text and/or 1D or 2D codes. The sample parts define the tolerance range, within which parts are identified as good, for each inspection characteristic. Up to 256 characteristics can be combined in a single program and up to

256 inspection programs can be stored on the camera.

The camera can also be used to carry out sorting functions, as it is capable of storing and distinguishing between up to 16 different part types per inspection program.

The characteristics calculated by the camera are not dependent on the rotary orientation and position of the inspection part, as they are determined relative to the position of the inspection part – any tilting and/or movement of the inspection part in the field of vision is therefore irrelevant for the inspection process.

The behaviour of the camera during inspection is determined by the evaluation mode. There are four different modes.

Evaluation modes		
Mode	Function	Application
Triggered	Frame capture and inspection with each valid triggering signal. The triggering signal is generated by a master controller or a sensor as soon as the inspection part is in front of the camera. The inspection results are output following the inspection, and the camera then waits for the next valid triggering signal.	Inspection of single parts when there is a triggering signal for image capture.
Idle run with image trigger with Compact Vision System SBOQ-RB	Image capture is performed continuously, but image evaluation only if there is an inspection part in front of the camera, i.e. if the trigger condition has been satisfied in a freely defined image area (e.g. a specific brightness is exceeded/fallen below). The inspection results are output following the inspection. The camera then waits for the next image-based trigger.	Inspection of single parts at a medium to fast rate without an external sensor.
Idle run without image trigger	Image capture and inspection (without fixed frame rate) are performed continuously. The triggering signal is permanently present, irrespective of whether or not there is an inspection part in front of the camera. The camera acts like a basic sensor. The inspection results are output following the inspection, and the camera then starts the next inspection immediately.	Inspection of single or continuous parts at a medium to fast (continuous) rate.

Programming

Integrated PLC

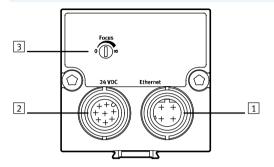

The integrated PLC can be programmed in all programming languages covered by IEC 61131-3 (e.g. LDR, ST, sequential function chart, etc.) using the software tool CODESYS provided by Festo. The predefined function blocks enable straightforward data exchange between the image processing task and the integrated PLC. This provides an easy means of implementing extensive inspection tasks or even communication between different cameras.

FESTO

Key features

Interfaces

Connection and display components

- 1 Ethernet connection
- 2 Operating voltage supply and inputs/outputs
- Adjusting screw for focus

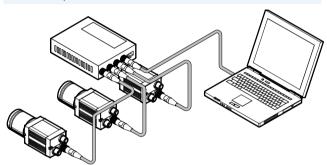

Inputs:

- Camera trigger
- Error acknowledgment

Outputs (can be parameterised):

- Ready status
- Good part correctly oriented
- Good part incorrectly oriented
- Reject part
- Error
- Warning
- External lighting

Ethernet - TCP/IP

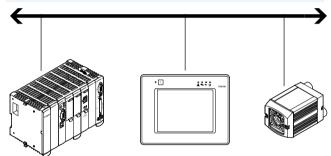

Commissioning and diagnostics: - PC for configuration and for

- Integration of the camera in a corporate network (integrated web server)

- Visualisation of the camera images and inspection results via SBO...-Q WebViewer

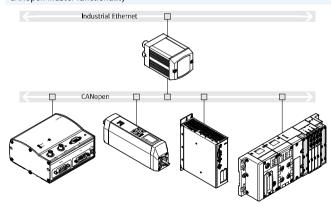

Ethernet – TCP/IP, EasyIP, Telnet, Modbus TCP

All parameters can be modified and all inspection results and characteristic values can be read via the Ethernet interface with EasyIP, Telnet and Modbus TCP.

CANopen master functionality

diagnostics with TCP/IP

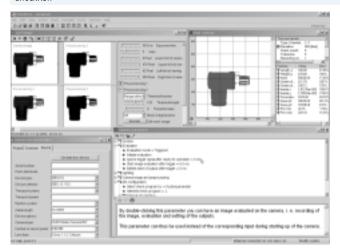

Servo controllers and remote I/O can be addressed directly via the CANopen master functionality.

Key features

Software

CheckKon

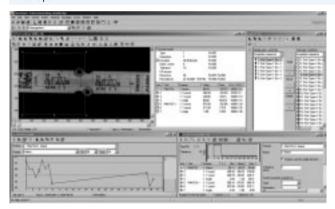

Using the CheckKon software, all processes within the camera – from image capture to the input and output parameters – can be displayed, logged and modified.

This includes:

- Selecting the evaluation mode
- Displaying and editing system parameters
- Displaying analysis of most recently inspected parts
- Displaying and logging inspection part images and the characteristics derived from them
- Loading new inspection programs
- System documentation

CheckOpti

CheckOpti is used to configure inspection programs. Following the presentation of sample parts, the user defines the characteristics to be inspected with the aid of the software. This is done by selecting the characteristics from a list and then dragging and dropping them to the area of the sample part to be inspected. A total of 256 performance characteristics can thus be defined and optimised within the framework of an inspection program. The inspection program can then be uploaded to one of the camera's 256 memory locations.

Examples of inspection characteristics:

- Vertical length measurement
- Horizontal length measurement
- Angle measurement
- Counting of events
- Measurements on the inspection part contour
- Area definition
- Calculation of grey tone or colour differences

FESTO

5

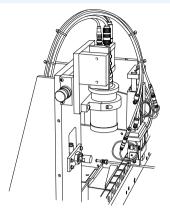

Key features

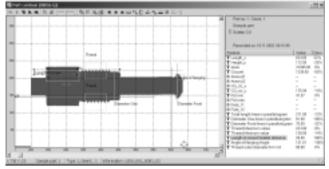

Application examples

Quality inspection of tube with union nut

The inspection takes place with backlighting; calculated characteristics:

- Length of nut
- Threaded coupling distances
- Diameter of tube
- Thread outside diameter
- Angle measurement on the flange
- Circumference of the screw
- Area of the screw

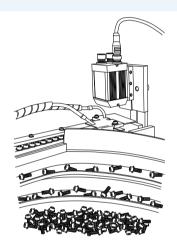

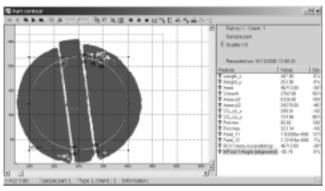

Screw type differentiation

The inspection takes place with reflected light; calculated characteristics:

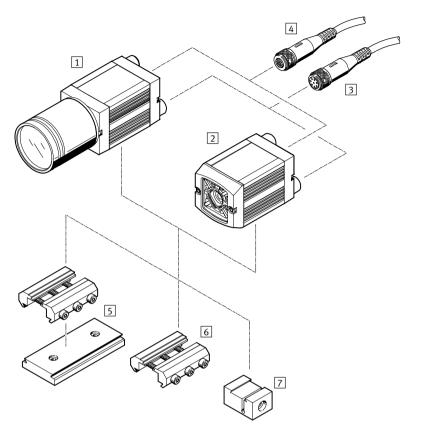

- Centre of gravity coordinates x, y
- Average grey tone of area
- Angle of screw drive to horizontal

Compact Vision Systems SBOC-Q/SBOI-Q Peripherals overview

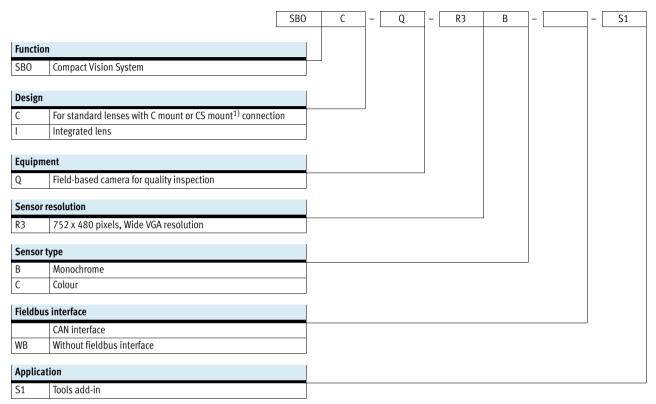

Accessories	Brief description	→ Page/Internet
Compact Vision System		
1 SBOC-Q	For standard lenses with C mount or CS mount ¹⁾ connection	8
2 SB0I-Q	With integrated lens and light	
Plug socket with cable		
3 SIM-M12-8GDPU	For supplying the operating voltage	13
Cable		
4 SBOA-K30E-M12S	Ethernet diagnostic cable	13
- SBOA-K20CP-WS	For integration in a CPI system	
- SBOA-K20CP-SUP	For I/O expansion	
Lens		
- SASF-C-L-F	Focal length 6 35 mm	12
Mounting attachments		
5 Adapter kit SBOA-HMSV-39	With screw-on adapter plate	11
6 Adapter kit SBOA-HMSV-40	Without screw-on adapter plate	
7 Adapter kit SBOA-HMSV-41	With female thread G1/4 for mounting on commercially available tripods	
 Adapter SBOL-C-5 	5 mm spacer ring (CS mount to C mount)	11
