

Key features

Innovative

- High-performance valves in sturdy metal housing
- Four valve sizes on one valve terminal
- Standardised from the multi-pin plug to the fieldbus connection and control block
- Dream team: fieldbus valve terminal suitable for electrical peripherals CPX. This means:
- Forward-looking internal communication system for controlling the valves and CPX modules
- Four valve sizes on one valve terminal without adapters
- Valve functions for integration in control architectures of higher categories to EN ISO 13849-1

Versatile

- Modular system offering a range of configuration options
- Expandable with up to 32 solenoid coils
 Conversions and extensions are
- possible at any time
- Manifold sub-bases can be extended using four screws, sturdy duct separation on metal support
- Integration of innovative function modules possible
- Supply plates enable a flexible air supply and variable pressure zones
- Reverse operation
 High pressure range -0.9 ... 10 bar,
- flow range 550 ... 4000 l/min
- Wide range of valve functionsValve supply: 24 V DC or 110 V AC

that can be replaced quickly and easily

fieldbus

Easy to install

- Assembled and inspected unit, ready for installation
- Reduced outlay on selection, ordering, installation and commissioning
- Secure mounting on wall or H-rail

Subject to change - 2019/05

Key features

Reduced downtimes: On-the-spot diagnostics via LEDs

Width 18 mm, 26 mm, 42 mm and 52 mm can be combined on a single valve terminal without adapter

Pneumatic interface to CPX

Simple electrical connections

- Fieldbus connection via CPX
- Multi-pin plug connection with pre-assembled cable or terminal strip (Cage Clamp®)
- Control block via CPX
- AS-Interface
- Individual connection
- CPX diagnostic interface for handheld devices (channel-oriented diagnostics down to the individual valve) Quick mounting: Direct mounting using screws or H-rail

Safe:

Valves, outputs and logic voltage can be switched off separately

Key features

Individual pneumatic connection

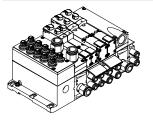

Valves on individual sub-bases up to width 52 mm can be used for actuators further away from the valve terminal.

The electrical connection is established either via a standardised 4-pin M12 plug, 24 V DC (EN 61076-2-101), 4-pin spring-loaded terminal or a

cable with open end, 24 V DC or 110 V AC, which are configured by the user.

FESTO

Valve terminal with individual electrical connection

Control signals from the controller to the valve terminal are transmitted via an individual connecting cable.

Control signals from the controller to

the valve terminal are transmitted via

a pre-assembled multi-wire cable or a

multi-pin plug connection assembled

by the user (spring-loaded terminal),

which substantially reduces

installation time.

The valve terminal can be equipped with max. 20 valves and max. 20 solenoid coils.

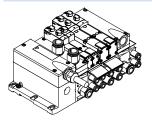

The valve terminal can be equipped

with max. 32 valves and max. 32

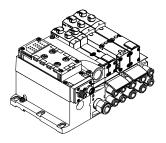

solenoid coils.

The electrical connection is established via a 5-pin M12 plug, 24 V DC.

Valve terminal with multi-pin plug connection

AS-Interface connection

A special feature of the AS-Interface is the simultaneous transmission of data and supply power via a two-wire cable. The encoded cable profile prevents connection with incorrect

polarity. The valve terminal with AS-Interface is

available in the following versions:

• With one to eight modular valve positions (max. 8 solenoid coils). This corresponds to 1 to 8 VSVA valves.

• With all available valve functions. The connection technology used for the inputs can be selected as with

Versions

- Multi-pin plug connection with terminal strip (spring-loaded terminal), 24 V DC or 110 V AC
- Pre-assembled connecting cable, 24 V DC
- Sub-D plug connector for assembly by the user, 37-pin
- Round plug connector M23, 19-pin, 24 V DC

CPX: M8, M12, quick connection, Sub-D, spring-loaded terminal (terminals to IP20).

Additional information

→ Internet: as-interface

Note

The valve terminal VTSA/VTSA-F with AS-Interface connection is based on the same electrical interlinking module as the valve terminal with multipin plug connection. This means it is possible to convert a valve terminal with multi-pin plug connection using an AS-Interface module

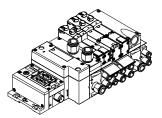

(→ Page 131). The technical specifications of the AS-Interface system must be observed in this case.

→ Page 58

→ Internet: as-interface

Key features

Valve terminal with fieldbus connection from the CPX system

An integrated fieldbus node manages the communication connection with a higher-order PLC. This enables a space-saving pneumatic and electronic solution. Valve terminals with fieldbus interfaces from the CPX system can be configured with up to 16 manifold sub-bases. With 2 solenoid coils per connection, up to 32 solenoid coils can thus be actuated.

Key features - Valves

Solenoid valve with switching position sensing, width 18 mm, 26 mm

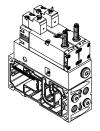

The 5/2-way single solenoid valve with spring return in width 26 mm features switching position sensing. The normal position of the piston spool valve is monitored.

Designed as a plug-in or individual connection valve with pilot valves to ISO 15218 and square plug type C. This valve is not a safety device in accordance with the Machinery Directive 2006/42/EC. It is suitable for use in safety-related parts of control systems to EN ISO 13849-1.

FESTO

→ Page 134

Control block with safety function, width 26 mm

5/2-way solenoid valve These valves are used for special

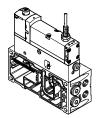

- applications, for example for:
- Protecting against unexpected start-up
- Safe reversing
- Drives in manually loaded devices

This control block is suitable for use as a press safety valve to EN 962.

This valve is a safety device in accordance with the Machinery Directive 2006/42/EC.

→ Page 144

Pilot air switching valve, width 18 mm, 26 mm

The pilot air switching valve is a combination of a 5/2-way solenoid valve with switching position sensing and the intermediate plate VABF-S4-...-S. It enables the pilot air supply to be verifiably switched on and off (sensor function) from duct 1 to 14 for the entire pressure zone or valve terminal. The piston position sensing feature is realised by means of an inductive PNP proximity sensor with cable and pushin connector in the size M12x1 to EN 61076-2-104.

This valve is not a safety device in

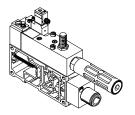

accordance with the Machinery Directive 2006/42/EC. It is suitable for use in safety-related parts of control systems to EN ISO 13849-1.

➔ Page 151

- Note

The pilot air switching valve can only be operated on the valve terminal VTSA/VTSA-F in combination with a right-hand end plate for external pilot air type VABE-S6-1RZ- Port 14 on the right-hand end plate must be sealed for this.

Soft-start valve, module width 43 mm

The soft-start valve is separately electrically actuated, independently of the multi-pin plug, AS-Interface or fieldbus connection, via a 4-pin plug to ISO 15407-1 or optionally via an M12 adapter.

The valve can optionally be ordered with a sensor that monitors switching

of the soft-start valve. The soft-start valve can supply the valve terminal or one or more pressure zones with supply air.

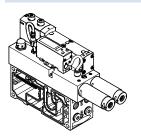

The pressure build-up for each pressure zone is optimised for the application directly at the valve terminal by setting the switch-over pressure and the filling time.

A maximum of 5 soft-start valves can be integrated on one valve terminal in this way.

➔ Page 160

Key features – Valves

Vacuum block, module width 53 mm

5/3-way solenoid valve, with switching position 12 retained. The vacuum block is screwed to a manifold sub-base for 2 valve positions, width 26 mm, and integrated into the valve terminal VTSA/VTSA-F. The vacuum block is supplied with electricity and the vacuum is sensed via a standardised 4-pin M12 plug. The vacuum block is used in conjunction with a suction gripper to receive, hold and place components. Placing is realised by means of an adjustable ejector pulse. The vacuum block is

equipped with an air-saving function. In the absence of electric or pneumatic supply, the valve reverts to switching position 12 "create vacuum".

- Possible applications:
- Pneumatic manual clamps for devices (inserting stations)

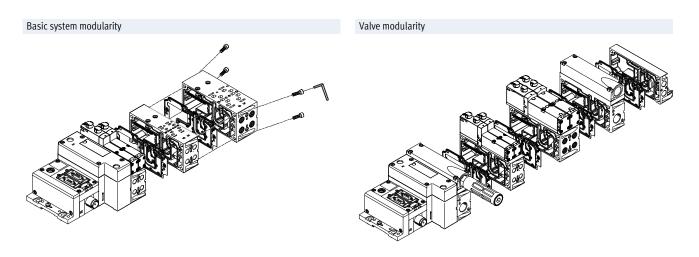

Possible applications:

• Pneumatic manual clamps for devices (inserting stations)

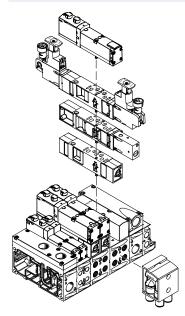

Peripherals

Modular pneumatic peripherals

The modular design of the valve terminal VTSA/VTSA-F enables maximum flexibility right from the planning stage and offers maximum ease of service in operation. The system consists of manifold sub-bases and valves. The manifold sub-bases are screwed together and thus form the support system for the valves. Inside the manifold sub-bases are the ducts for supplying compressed air to and exhausting from the valve terminal as well as the working ports for the pneumatic cylinders for each valve. Each manifold sub-base is connected to the next using four screws. Individual valve terminal sections can be isolated and further blocks easily inserted by loosening these screws. This ensures that the valve terminal can be rapidly and reliably extended.

Vertical stacking modularity

- Note

See also "Adaptation to width 65 mm, ISO size 3

(technology type 04)" → page 176

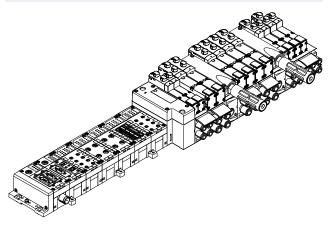

Peripherals

Modular electrical peripherals

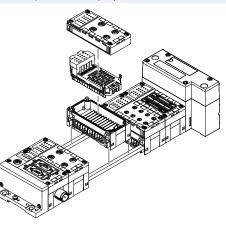

The manner in which the valves are actuated differs according to whether you are using a multi-pin terminal or fieldbus terminal. The VTSA/VTSA-F with CPX interface is based on the internal bus system of the CPX and uses this communication system for all solenoid coils and a range of electrical input and output functions. Parallel linking enables the following:

- Transmission of switching information
- Compact design
- Position-based diagnostics
- Separate voltage supply for valves
- Flexible conversion without address shifting
- Option of CP interface
- CPX-CEC as stand-alone controller with access via Ethernet and web server
- Transmission of status, parameter and diagnostic data
- → Internet: cpx

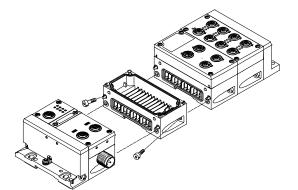

VTSA/VTSA-F with electrical peripherals CPX

Modularity with electrical peripherals CPX

CPX terminal in metal design

The CPX modules in metal design are mechanically connected to one another using an angled fitting. The CPX terminal can thus be expanded at any time.

- Note

The CPX connection blocks are also available in a metal design. This means a complete solution in a sturdy metal design can be selected for applications of the valve terminal VTSA/VTSA-F in welding environments.

Peripherals – Pneumatic components

Valve terminal widths

Order code for VTSA:

- 44E-... for the electrical components
- 44P-... for the pneumatic components

Order code for VTSA-F:

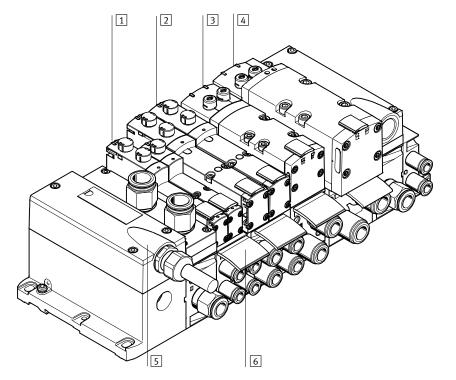

- 45E-... for the electrical components
- 45P-... for the pneumatic components

Regardless of the type of actuation (e.g. multi-pin plug, fieldbus, etc.), valve terminals VTSA/VTSA-F in the widths

- 18 mm
- 26 mm
- 42 mm
- 52 mm

can be combined without adapters. This enables a flow range of 400 l/min to 2,900 l/min in the case of VTSA and 700 l/min to 2,900 l/min in the case of VTSA-F to be covered on one valve terminal. A wide range of valve functions and vertical stacking components are available for all widths. Valves with a width of 65 mm can be mixed with other widths. However, these are only configured after the adapter plate VABA and are thus always at the end of the valve terminal configuration.

Peripherals – Electrical components

Valve terminal with AS-Interface connection

Order code for VTSA:

- 52E-... for the electrical components
- 44P-... for the pneumatic components

Order code for VTSA-F:

- 52E-... for the electrical components
- 45P-... for the pneumatic components

Valve terminals VTSA/VTSA-F with AS-Interface connection can be expanded with up to 8 valves with max. 8 solenoid coils.

The manifold sub-bases for valves with a width of 18 or 26 mm are either prepared for

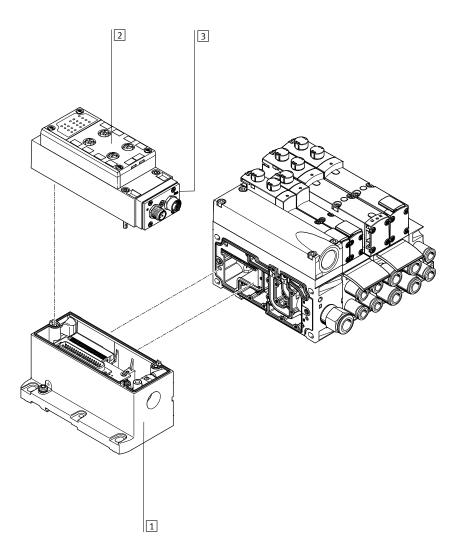

- 2 single solenoid valves or
- 2 double solenoid valves

and the manifold sub-bases for valves with a width of 42, 52 and 65 mm are prepared for

- 1 single solenoid valve or
- 1 double solenoid valve.

- Double solenoid valve positions can be equipped with any valve or a blanking plate.
- Single solenoid valve positions can only be equipped with single solenoid valves or a blanking plate.
- Valves with a width of 65 mm cannot be mixed with other widths these are always at the end of the valve terminal configuration. See "Adaptation to width 65 mm, ISO size 3 (technology type 04)"

→ Page 176

		Description	→ Page/Internet

Peripherals - Electrical components

Valve terminal with fieldbus connection, control block (electrical peripherals CPX)

Order code:

- 50E-... for the electrical peripherals, plastic manifold module
- 51E-... for the electrical peripherals, metal manifold module
- 53E-... for the electrical peripherals, for control cabinet installation
- For VTSA:
- 44P-... for the pneumatic components

For VTSA-F:

• 45P-... for the pneumatic components

Valve terminals VTSA/VTSA-F with fieldbus interface can be expanded with up to 32 valves with max. 32 solenoid coils.

The manifold sub-bases for valves with a width of 18 or 26 mm are either prepared for

- 2 single solenoid valves or
- 2 double solenoid valves

and the manifold sub-bases for valves with a width of 42, 52 and 65 mm are prepared for

- 1 single solenoid valve or
- 1 double solenoid valve.

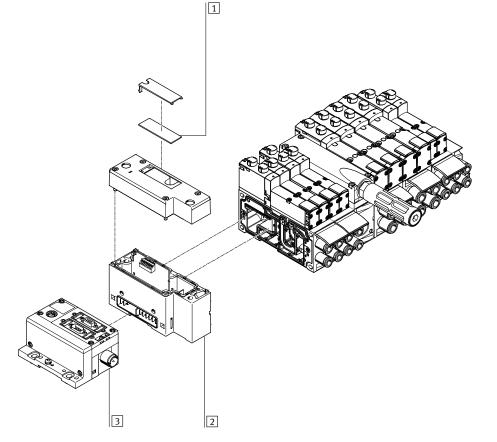

- Double solenoid valve positions can be equipped with any valve or a blanking plate.
- Single solenoid valve positions can only be equipped with single solenoid valves or a blanking plate.

Each valve position can be equipped with any valve or a blanking plate. The rules for CPX apply to the equipment that can be used in combination with the electrical peripherals CPX. In general:

- Max. 10 electrical modules
- Digital inputs/outputs
- Analogue inputs/outputs

- Parameterisation of inputs and outputs
- Integrated convenient diagnostic system

- Preventive maintenance concepts
- Valves with a width of 65 mm cannot be mixed with other widths these are always at the end of the valve terminal configuration. See "Adaptation to width 65 mm, ISO size 3 (technology type 04)"

Peripherals – Electrical components

Valve terminal with fieldbus/multi-pin plug connection and individually electrically actuated valve

In applications with specific emergency off conditions, it may be necessary to switch one or more valves separately from the valve terminal controller. Standard valves (VSVA) with individual electrical connection (round or square plug) are mounted on the valve terminal to this end. In order for protection class IP65 to be achieved, the functionless opening in the sub-base for the electrical connection must be sealed. A sealing cap is available for the 18 mm and 26 mm widths.

With manifold or individual subbases, valves with width 42 mm and 52 mm must be used with a seal to comply with the

IP protection class (see → page 130). For central control of the valve terminal via a multi-pin plug or fieldbus

connection, the valve position
occupied in this way acts like a vacant
position, i.e. the assigned address in
the fieldbus node or the correspond-
ing connection in the multi-pin plug
connection is occupied.

	Description	→ Page/Internet
1 Sealing cap	For sealing the electrical connection on the sub-base	130

5 Valve	Width 42 mm or width 52 mm	valves vsva

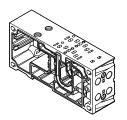

- Note

Standard valves VSVA can be used for valve terminal allocation. A vacant position must be provided for this in the valve terminal configurator. The corresponding standard valve VSVA can be ordered on the Internet at:

→ vsva

Key features – Pneumatic components

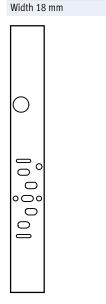

Manifold sub-base

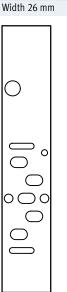

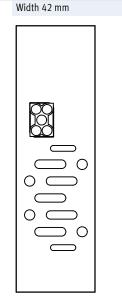

VTSA/VTSA-F is based on a modular system which consists of manifold sub-bases and valves. The VTSA-F manifold sub-bases are designed to optimise flow. Manifold sub-bases are available for valve widths 18 mm and 26 mm in a double grid, i.e. two valves per manifold sub-base. For valves with a width of 42 mm or 52 mm, there are manifold sub-bases with one valve per sub-base. The manifold sub-base contains a duct seal and an electrical interlinking module. They can be freely mixed within a valve terminal. The manifold sub-bases are screwed together and thus form the support system for the valves. Inside the manifold sub-bases are the ducts for supplying compressed air to and exhausting from the valve terminal as well as the working ports for the pneumatic cylinders for each valve. Each manifold subbase is connected to the next using four screws. Individual valve terminal sections can be isolated and further manifold sub-bases inserted by loosening these screws. This ensures that the valve terminal can be rapidly and reliably extended.

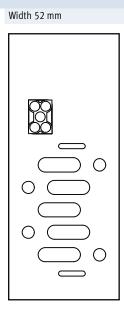

See also "Adaptation to width 65 mm, ISO size 3 (technology type 04)" → Page 176

Port patterns on the manifold sub-base for one valve position

- Note

The illustrations shown depict a schematic representation of the pneumatic ISO port patterns.

The port patterns on the valve terminal VTSA-F do not correspond to the ISO standard.

Key features - Pneumatic components

Sub-base valve

All valves are fitted with piston spool and patented sealing system, which ensures efficient sealing, a broad operating pressure range and long service life. Sub-base valves can be quickly replaced since the tubing connections remain on the manifold sub-base. Irrespective of the valve function there are sub-base valves with one solenoid coil (single solenoid) or with two solenoid coils for double solenoid or double valve functions.

Reverse/vacuum operation

Select reverse operation (code Z) if you wish to operate an actuator (cylinder) with different pressures for the forward and return stroke. Please note that the valves must then be operated via a separate pressure zone. The reversible 3/2-way solenoid valves are also suitable for vacuum operation.

- 📲 - Note

- If a pressure zone is in reverse operation, supply air is connected to port 3/5 and exhausting takes place at port 1 at all valve positions in this pressure zone.
- Reversible pressure regulators cannot be selected when a pressure zone is in reverse operation.

- Reverse operation is only possible in pressure zones with external pilot air supply.
- With reversible pressure regulators, only the valve at this position is in reverse operation.
- When using 5/3-way valves in reverse operation, the mid-position function switches from exhausted to pressurised and vice versa.

Blanking plate

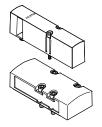

Plate without valve function for reserving valve positions on a valve terminal.

Valve and blanking plates are attached to the manifold sub-base using screws.

Design

Valve replacement

The valves are attached to the metal manifold sub-base using two or four screws, which means that they can be easily replaced. The mechanical robustness of the manifold sub-base guarantees efficient long-term sealing.

Extension

Vacant positions can be fitted with valves at a later date. The dimensions, mounting points and existing pneumatic installations remain unchanged during this process. For more information and technical data on expansion, refer to the user documentation:

→ Internet: P.BE-VTSA-44

Key features – Pneumatic components

Vertical stacking

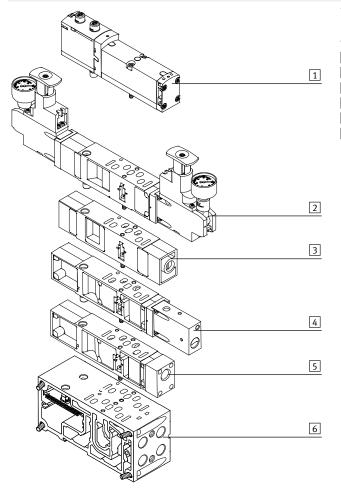

Additional function units can be added to each valve position between the sub-base (manifold sub-base) and the valve. These functions are known as vertical stacking modules and enable special functioning or control of an individual valve position. Combinations of several valve sizes on one valve terminal are possible.

- Note

Certain combinations are not recommended due to the design of the individual vertical stacking components.

Vertical stacking components

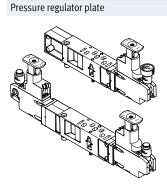

The following component sequence is recommended for valve positions with vertical stacking:

 1
 Valve VSVA

- 2 Pressure regulator plate
- 3 Flow control plate
- 4 Vertical pressure shut-off plate
- 5 Vertical supply plate
- 6 Manifold sub-base

Key features - Pneumatic components

Vertical stacking

An adjustable pressure regulator can be installed between the sub-base (manifold sub-base) and the valve in order to control the force of the triggered actuator. This pressure regulator maintains an essentially constant output pressure (secondary side) independent of pressure fluctuations (primary side) and air consumption. Also suitable for valves with symmetrical coil layout.

Standard version:

- Standard port pattern to ISO 15407-2 or ISO 5599-2
- For regulating range up to 6 bar or up to 10 bar

FESTO

- Without pressure gauge (optional)
- Regulator knob with 3 positions (locked, reference position, free running)

- 📱 - Note

With the A, B and AB pressure regulators VABF-S...-1-..., the regulated pressure should not be less than 2 bar. Use the reversible A, B or AB pressure regulators for regulated pressure less than 2 bar.

🚪 - Note

Please note for repeat orders of pressure regulators in sizes 42 mm and 52 mm:

The part number imprinted on the regulator plate refers only to the standard equipment.

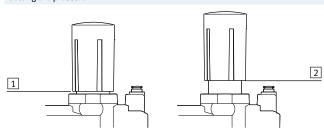

When reordering pressure regulators with additional features, such as a lockable rotary knob, extended design, etc., only use the VABF configurator.

→ Internet: vabf-s2

1 Pull the rotary knob upward out of the locking level (1) into the setting level

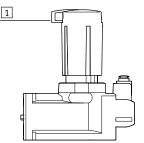

Set the desired pressure in the setting level (2) using the rotary knob
 After setting the pressure, push the rotary knob down, back into the locking

Rotary knob for pressure regulator for width 42 mm and 52 mm Setting the pressure

Rotary knob for pressure regulator for width 42 mm and 52 mm

Locking the rotary knob

After setting the pressure, the rotary knob can be locked against unauthorised actuation. To do this, the blue locking element is pushed out and secured with a

padlock. The rotary knob is now fixed in place and cannot be moved.

- Note

locking elements.

(2)

level (1)

The position of the rotary knob and the locking element is determined by the pressure setting. If a number of pressure regulators are installed next to one another, there may be an unfortunate space

issue leading to collision of the

To ensure that locking is still possible in this situation, the rotary knob can be completely pulled off, rotated through 60° or 120° and pushed back on.

Further information:

Key features - Pneumatic components

Vertical stacking

Energy efficiency through dual-pressure operation or through operation with reversible pressure regulators

Energy conservation starts right from compressed air generation. It is possible to achieve an energy saving of up to 10% per 1 bar drop in pressure. Therefore, wherever possible reduce the pressure to the minimum required.

To save additional energy, you can operate valves in dual-pressure mode in a separate pressure zone.

To do this, the valves used must be operated in reverse mode, i.e. with reversed direction of flow (see also note on \rightarrow page 86). In dual-pressure operation, the valves are then supplied with pressure separately via ducts 3 and 5. The air is vented via duct 1.

Dual-pressure operation with standard controller

Requirements for dual-pressure operation:

- Exhaust ducts 3 and 5 in the pressure zone are completely separate.
- Valves are used that can be operated in reverse mode.

Advantages of dual-pressure operation:

It is possible to save energy if different pressures can be applied to one valve. The advantages are:

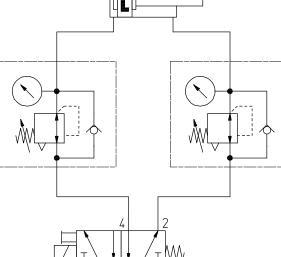

- Saves energy because the return stroke can be carried out using reduced force, e.g. 3 bar instead of 6 bar.
- Just one valve is required, as in the case of vacuum application with ejector pulse for example (e.g. duct 3 for vacuum switching, duct 5 for the ejector pulse).
- A reduction in compressed air consumption of up to 50% is possible if two different pressures can be applied to the valve (return stroke uses reduces pressure).

Dual-pressure operation with reversible controller

pressure regulator upstream of the valve (circuit diagram 2), exhausting is directly via the solenoid valve. This has the following advantages:

- · Increased exhaust capacity, venting is up to 50% quicker
- regulator
- Very finely adjustable, perfect for
- required.
- The pressure regulator can be adjusted independently of the valve position because operating pressure is permanently present at the pressure regulator.

Circuit diagram 2:

Circuit diagram 1: Pressure is regulated downstream of the valve

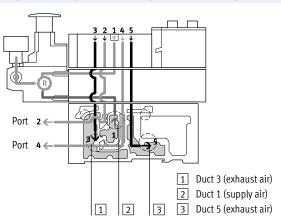

Pressure is regulated upstream of the valve

- Lower wear on the pressure
- very low operating pressures
- No guick exhaust valves are
- Fast cycle times

Key features - Pneumatic components

Vertical stacking

Mode of operation of the pressure regulator plate (P regulator) for port 1; code: ZA, ZAY, ZF, ZFY

Advantages

- The pressure regulator is not affected by venting, since the pressure is regulated upstream of the valve.
- The pressure regulator can always be adjusted, since the pressure from the valve terminal is always present.

This pressure regulator regulates the pressure upstream of the valve in duct 1. Ducts 2 and 4 thus have the same regulated pressure.

During venting, the exhaust flow in the valve is from duct 2 to duct 3 and from duct 4 to duct 5.

Application examples

- An equal working pressure is required at working ports 2 and 4.
- A lower working pressure

This pressure regulator regulates the

pressure in ducts 2 and 4 after the

pressure medium flows through the

valve. During venting, the exhaust

3 and from duct 4 to duct 5 via the

flow in the valve is from duct 2 to duct

(e.g. 3 bar) than the operating pressure present at the valve terminal (e.g. 8 bar) is required.

Example with the following switching

The air flows from duct 1 of the mani-

fold sub-base via the valve to duct 2.

it is then regulated and made avail-

able at port 2 of the manifold sub-

base. At the same time, venting takes

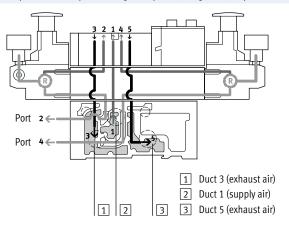

place via duct 4 of the manifold subbase, via the regulator and via the

valve into duct 5 of the manifold

position:

sub-base.

Mode of operation of the pressure regulator plate (AB regulator) for ports 2 and 4; code: ZD, ZDY, ZI, ZIY

Restrictions

 The pressure regulator cannot be adjusted in the exhaust position.
 For example, the pressure regulator for duct 4 cannot be adjusted when the valve is pressurised in the switching position from duct 1 to duct 2 and exhausted from duct 4 to duct 5.

Application examples

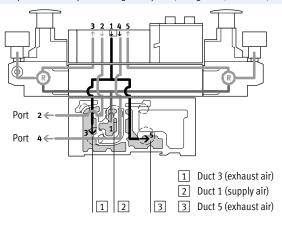

pressure regulator.

• Two different working pressures are required at ports 2 and 4 instead of the valve terminal operating pressure.

Key features – Pneumatic components

Vertical stacking

Mode of operation of the pressure regulator plate (AB regulator, reversible) for ports 2 and 4, reversible; code: ZE, ZEY, ZJ, ZJY

Application examples

- Two different pressures are required in ducts 2 and 4 instead of the valve terminal's operating pressure.
- Quick exhausting is required.
- The pressure regulator must always
 - be adjustable.

With this pressure regulator, the air (duct 1) is split and routed directly to both pressure regulators. In each case the regulated air is present in ducts 3 and 5 on the valve. The valve is thus operated in reverse mode. This means:

- Duct 3 routes the working pressure to port 2
- Duct 5 routes the working pressure to port 4

Example with the following switching position:

The air in duct 1 is split between ducts 3 and 5 in the regulator and flows from here to the valve. In the valve, the air is routed to port 2 of the manifold sub-base. The exhaust air is simultaneously routed via duct 4 of the manifold sub-base and via the valve to regulator duct 1, where it is split between ducts 3 and 5 and then discharged via the manifold sub-base.

- Note
- Reversible pressure regulator plates should only be combined with valves that can be operated in reverse mode.
- Valves in valve positions with vertical pressure shut-off plates are operated with internal pilot air, even when the valve terminal is operated with external pilot air supply.
- The following combination of reversible valve terminals with vertical stacking components is not permitted:
 - Reversible pressure regulator plates
 - Flow control plates
 - Vertical pressure shut-off plates
 - Vertical supply plates

Advantages

- Fast cycle times
- 50% higher exhaust flow rate, as air is not exhausted via the pressure regulator. The load on the pressure regulator is also reduced.
- No quick exhaust valves are required.
- Operating pressure is always present at the pressure regulator, as the pressure is regulated upstream of the valve, i.e. the regulator can always be adjusted.

Disadvantages

- 2x 3/2-way solenoid valves (code N, K, H) cannot be used, as pressure is present at ports 3 and 5.
- No practical combination with a flow control plate possible.

These functions are available via the pressure regulator configurator VABF-S2 for width 42 mm and 52 mm (ISO 5599-2, ISO 1 and ISO 2) only Alternatively they can be selected for all four sizes in the valve terminal configurator or via their own order numbers in the chapter Accessories on page 129
 All variants are only possible with VABF-S2

Key features – Pneumatic components

Vertical stacking

Flow control plate

The flow control plate is equipped with two flow control valves on which the exhaust air flow rate at exhaust ports 3 or 5 can be adjusted. This enables the movement of the drive to be initiated and the desired speed to be set on the valve terminal using the manual override. Ducts 3 and 5 can be adjusted independently of each other.

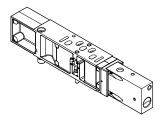

- Note

On reversible valve terminals, the air flow is controlled in ducts 3 and 5 upstream of the valve.

FESTO

Code	Туре	Width	P	T	T	Description
		18 mm	26 mm	42 mm	52 mm	
Х	VABF-S4F1B1-C					 Restricts the exhaust air downstream of the valve in ducts 3 and 5

Vertical pressure shut-off plate

The vertical pressure shut-off plate is equipped with a switch via which the compressed air supply can be shut off. This enables a solenoid directional control valve or subsequent vertical stacking plate to be replaced without switching off the overall air supply. If the control chain has a redundant connection, the cycle can continue in the case of a cyclical control system. Following activation of the shut-off, the exhaust air/return air from the actuated valve is discharged. This takes place via an M5 threaded connection or via duct 3 in the case of width 18 and 26 mm, and via duct 3 in the case of width 42 and 52 mm.

- Note

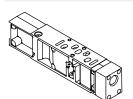

The operating pressure of the valve terminal must lie within the range of the required pilot pressure (i.e. min. 3 bar). When using the end plate with pilot air selector, only the switching position with the code W and U can be used.

ZT	VABF-S4L1D1-C	•	•	-	-	 3/2-way valve for shutting off the operating pressure at the valve position Blocks ducts 1 and 14 for the valve position
	VABF-S2L1D1-C	-	-	•		 Supplies the valve position with internal pilot air Pressure separation at the valve assembly
ZS	VABF-SL1D2-C			-	-	 3/2-way valve for shutting off the operating pressure at the valve position Blocks ducts 1 and 14 for the valve position Supplies the valve position with internal pilot air Key-operated pressure separation at the valve assembly

- Note

The vertical pressure shut-off plates VABF-... are provided only in combination with VSVA-...T1L solenoid valves from Festo. In the vertical pressure shut-off plate only ducts 1 and 14, and not duct 12, are blocked.

Vertical supply plate

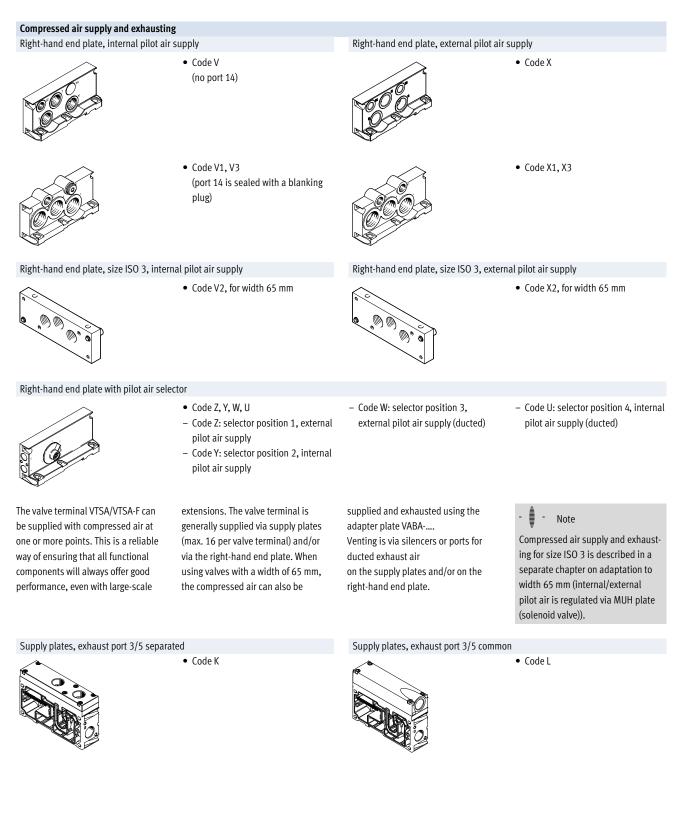

This plate enables a valve to be supplied with individual operating pressure independently of the operating pressure of the valve terminal.

As additional pressure supply for a valve. To supply an additional pressure zone.

Code		Туре	Width				Description

Key features – Pneumatic components

Key features – Pneumatic components

Additional compressed air supply/duct separation

Additional supply plates can be used to ensure the compressed air supply for larger valve terminals or to create additional pressure zones.

These can be selected at any point upstream or downstream of the manifold sub-bases.

Supply plates contain the ports:

- Compressed air supply (1)
- Exhaust port (3/5) common or separated

Depending on your order, the exhaust air ducts are either ducted or exhausted via silencers.

VTSA/VTSA-F with ducted exhaust air:

With ducted exhaust air, venting can be via a supply plate or a right-hand end plate (code V or X). If duct separation is required, there are three different options:

- Duct separation 1, 3, 5: code S
- Duct separation 1: code T
- Duct separation 3, 5: code R

If a combination of duct separation (S, T or R) and one or two supply plates is required, the following variants can be selected:

- Supply plate with duct separation on the left-hand side: code SU, TU, RU
- Supply plate with duct separation on the right-hand side: code US, UT, UR
- 2 supply plates with intermediate duct separation: code USU, UTU, URU

Supply	plates

USU UTU URU							2 supply plates with duct separation in centre, if R, S or T selected

Key features - Pneumatic components

Right-hand end plate

Right-hand end plates with different port sizes are available depending on the air rate required.

With the following right-hand end plates, the outlet direction of the ports is aligned with the horizontal stacking direction.

Right-hand end plates with pilot air supply/pilot exhaust air

- Internal pilot air supply: code V, V1, V2 and V3 (ducts 1 and 14 are connected)
- External pilot air supply: code X, X1, X2 and X3, as well as XP1, XP2, XP3 and XS

For end plates with pilot air selector, the outlet direction of the ports is to the front of the valve terminal. This means that all the ports on the valve terminal can be combined in one outlet direction.

The special feature of the end plates with pilot air selector is the selector switch itself, which has four settings for different pilot air supply/pilot exhaust air.

End plates with pilot air selector switch set at the factory for:

- External pilot air supply: selector position 1 (code Z)
- Internal pilot air supply: selector position 2 (code Y)
- External pilot air supply, ducted pilot exhaust air: selector position 3 (code W)
- Internal pilot air supply, ducted pilot exhaust air: selector position 4 (code U)

Note

- The end plate with pilot air selector must be used in combination with an air supply plate.
- The reversible 3/2-way solenoid valves (code P, Q, R) must only be operated in selector position 1 or 2.
- Ducted pilot exhaust air via port 12 is only possible with rotated seals on the valve.

Ducted pilot exhaust air:

• The seal is visible in the inspection window on control side 12.

FESTO

• The "ISO" mark is visible on the designation label on the seal surface.

Pilot air supply

The port for the pneumatic supply is located on the supply plates or the right-hand end plate.

Internal pilot air supply

Internal pilot air supply can be selected if the working pressure is between 3 and 10 bar.

In this case the pilot air supply is branched from the compressed air supply 1 using an internal connection. Port 14 is not available with code V and is sealed with a blanking plug for code V1, V2, V3.

The ports differ for the following types

of pilot air supply:

• Internal

• External

🛔 - Note

If a gradual pressure build-up is air required in the system by means of a pil soft-start valve, then external pilot the

air should be selected whereby the pilot pressure is already applied at the point of switch-on.

External pilot air supply

If the supply pressure is less than 3 bar, you must operate your valve terminal VTSA/VTSA-F using external pilot air supply. The pilot air supply is then supplied via port 14 on the right-hand end plate. This is the case even if the valve terminal is operated with different pressure zones.

- Note

When using valves with a width of 65 mm, ISO size 3, the internal/ external pilot air supply for the valves with a width of 18 ... 52 mm is provided via the adapter plate

VABA-.... The external pilot air supply for the valves with a width of 65 mm is provided via the right-hand end plate IEPR

Key features – Pneumatic components

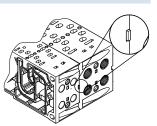

Creating pressure zones and separating exhaust air

The valve terminal VTSA/VTSA-F offers a number of options for creating pressure zones if different working pressures are required.

Pressure zones are created by isolating the internal supply ducts between the manifold sub-bases by means of appropriate duct separation.

. ..

Compressed air is supplied and exhausted via a supply plate. The position of the supply plates and duct separations can be freely selected for VTSA/VTSA-F. Duct separations are integrated ex-works as per your order. Duct separations can be distinguished by their coding, even when the valve terminal is assembled.

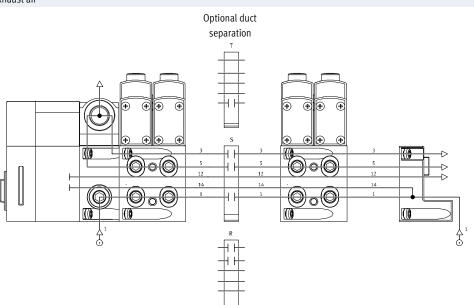

Creating	g pressure zones						
Code	Separating seal		Width				Description
	Illustrated examples	Coding	18 mm	26 mm	42 mm	52 mm	
Т							Duct 1 separated
S							Ducts 1, 3 and 5 separated
R							Ducts 3 and 5 separated

Examples: Compressed air supply and pilot air supply, right-hand end plate

Internal pilot air supply, silencer/ducted exhaust air

Right-hand end plate: code V and V1

The adjacent diagram shows an example of the configuration and connection of the compressed air supply with internal pilot air supply. Port 14 is not available with code V and is sealed with a blanking plug for code V1. At exhaust port 3/5 the air is discharged via the silencer. Duct separations can optionally be used to create pressure zones.

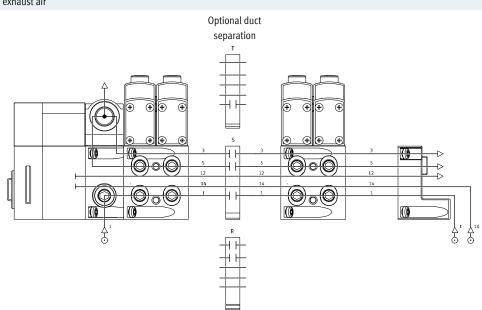

Key features - Pneumatic components - Compressed air supply and pressure zones, examples

Examples: Compressed air supply and pilot air supply, right-hand end plate

External pilot air supply, silencer/ducted exhaust air

Right-hand end plate: code X and X1

The adjacent diagram shows an example of the configuration and connection of the compressed air supply with external pilot air supply. Port 14 on the right-hand end plate is equipped with a fitting for this. The air is exhausted via the silencer at exhaust port 3/5. Duct separations can optionally be used to create pressure zones.

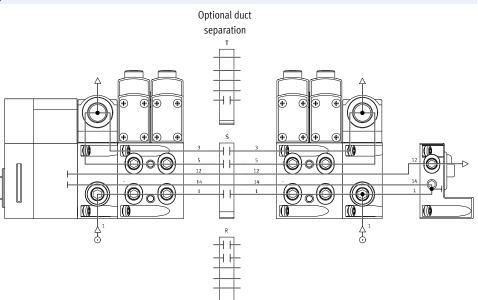

Examples: Compressed air supply and pilot air supply via end plate with pilot air selector

Internal pilot air supply, ducted exhaust air/silencer

Right-hand end plate: code U

The adjacent diagram shows an example of the configuration and connection of the compressed air supply with internal pilot air supply. Port 14 on the right-hand end plate is tightly sealed. At exhaust port 3/5 the air is ducted or discharged via the silencer. The selector switch on the pilot air selector is in position 4. Duct separations can optionally be used to create pressure zones.

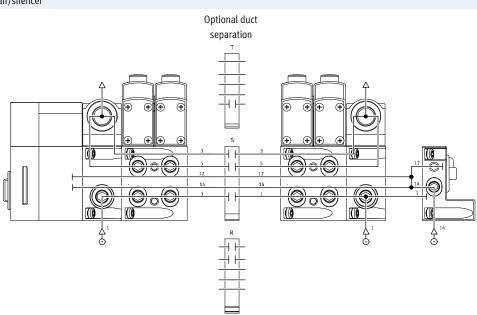

Key features - Pneumatic components - Compressed air supply and pressure zones, examples

Examples: Compressed air supply and pilot air supply via end plate with pilot air selector

External pilot air supply, ducted exhaust air/silencer

Right-hand end plate: code Z

The adjacent diagram shows an example of the configuration and connection of the compressed air supply with external pilot air supply. Port 14 on the right-hand end plate is equipped with a fitting for this. Port 12 is sealed with a blanking plug since it is internally connected with port 14. At exhaust port 3/5 the air is ducted or discharged via the silencer. The selector switch on the pilot air selector is in position 1. Duct separations can optionally be used to create pressure zones.

Examples: Creating pressure zones

VTSA/VTSA-F with CPX terminal With the VTSA/VTSA-F, up to 16 pressure zones can be created (up to 32 pressure zones if only size 1, ISO 5599-2, is fitted). The diagram shows an example of the configuration and connection of three pressure zones using duct separations – with internal pilot air supply.

 Note
 Examples with pressure zones and soft-start valve are described separately in the

chapter "Soft-start valve"→ page 163.

on the catalogue DVD or online.

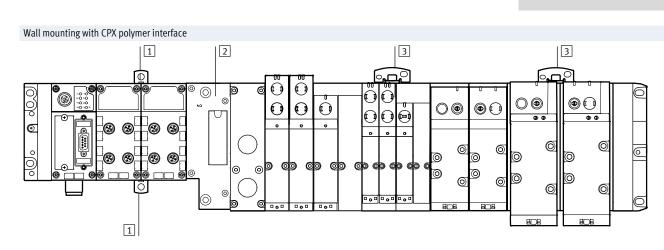

→ Internet: 2D/3D CAD

→ www.festo.com/sp

Note

Note the following information to avoid damage to the valve terminal:

- Additionally use mounting brackets of the type VAME-S6-W-M46
- Mount these at each fourth plate (manifold sub-base, supply plate or exhaust plate), counting from left to right, starting after the pneumatic interface.
- No mounting bracket is required next to the right-hand end plate.
- Make sure to use the pre-assembled mounting brackets when mounting factory pre-assembled valve terminals on a wall.

1 Additional wall mounting for polymer CPX terminal

In the case of CPX terminals in polymer design with 4 and more interlinking blocks, additional wall mountings of the type CPX-BG-RW must be used 2 Pneumatic interface

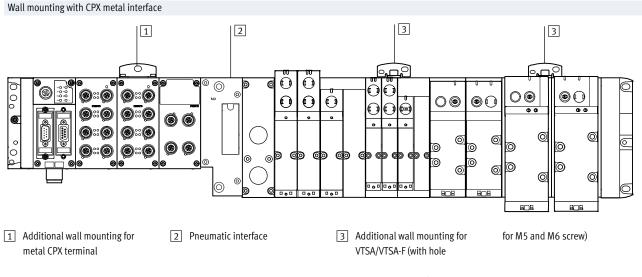

approx. every 100 ... 150 mm. These mountings are clipped in at the top and bottom between the CPX modules. 3 Additional wall mounting for VTSA/VTSA-F (with hole

In the case of the VTSA/VTSA-F, mounting brackets must be mounted on the wall as instructed above. for M5 and M6 screw)

Brackets of the type VAME-S6-W-M46 must be used as an additional wall mounting.

Key features - Assembly

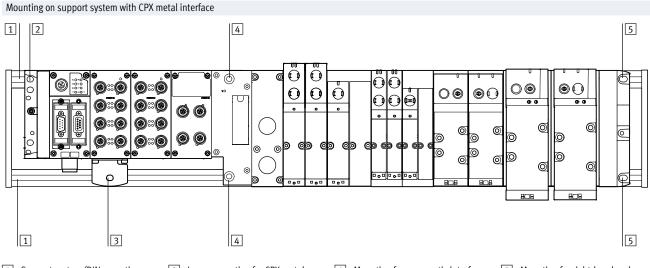

FESTO

In the case of CPX terminals in metal design with 4 and more interlinking blocks, additional wall mountings of the type CPX-M-BG-RW must be used

approx. every 100 ... 150 mm. These wall mountings are screwed in at the top on the corresponding CPX module.

In the case of the VTSA/VTSA-F, mounting brackets must be mounted on the wall as instructed above. Brackets of the type VAME-S6-W-M46 must be used as an additional wall mounting.

- Support system (DIN mounting rail)
- 2 Upper mounting for CPX metal, left-hand end plate on DIN mounting rail

If a terminal CPX (metal version) with VTSA pneumatics is mounted on DIN mounting rails, it may be necessary to have one or more mounting brackets on the CPX side to compensate for the length. Length compensation is made 3 Lower mounting for CPX metal on DIN mounting rail with mounting bracket CPX-M-BG-VT-2X

CPX-M-BG-VT-2X. The mounting

rail.

bracket connects the terminal CPX

(metal version) to the DIN mounting

- 4 Mounting for pneumatic interface on DIN mounting rail
- 5 Mounting for right-hand end plate on DIN mounting rail

- Note

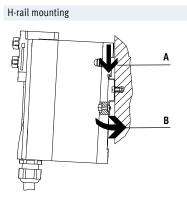

- Only CPX modules (metal version) with VTSA/VTSA-F modules of width 18 ... 52 mm may be used.
- The number of mounting brackets required depends on the number of CPX modules installed and whether any system feeds are

present.

Further information about assembling the valve terminal can be found in the assembly instructions in the Festo Support portal.

- → Internet: 2D/3D CAD
- → www.festo.com/sp

Key features – Assembly

The valve terminal VTSA/VTSA-F is hooked onto the H-rail (see arrow A). It is then swivelled onto the H-rail and secured in place with the clamping component (see arrow B).

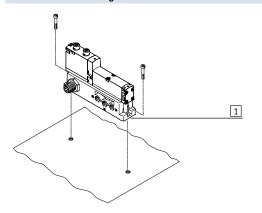

For H-rail mounting of the valve terminal you will need the following VTSA/VTSA-F mounting kit: • CPX-CPA-BG-NRH

This enables the valve terminal to be mounted on an H-rail to EN 60715.

- Note

- Wall mounting is recommended if more than one vertical stacking element or a long valve terminal design is required.
- Vibration/shock loads are not permissible with H-rail mounting.
- Only horizontal mounting position are permissible with H-rail mounting.

Individual valve mounting

1 Vertical mounting holes

The individual sub-base for wall mounting is designed for integration into a system or machine. It is mounted vertically.

Key features - Display and operation

Display and operation

Each solenoid coil is allocated an LED which indicates its switching status.

- Indicator 12 shows the switching status of the pilot control for output 2
- Indicator 14 shows the switching status of the pilot control for output 4

Manual override (MO):

The manual override enables the valve to be switched when not electrically actuated or when de-energised. The valve is switched by pushing the manual override. The set switching status can also be locked by turning the manual override.

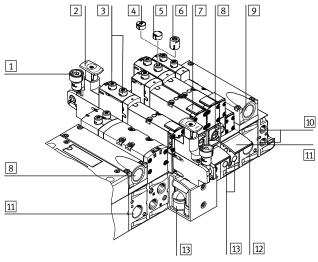

Alternatives:

- The cover cap (code N) limits the func- The cover cap (code V) can be used tion of the manual override, preventing it from being locked. The valve can then be actuated with non-detenting operation only.
 - to secure the manual override against accidental actuation.
 - The heavy-duty cover cap protects the manual override located on the valve. The valve can be actuated as non-detenting or as detenting via accessory.

Special valve variants with preoverride are available for valve assembled cover caps for the manual terminal VTSA/VTSA-F.

Pneumatic connection and control elements

Electrical connection and display components

2 Adjusting knob for optional pressure regulator plate 3 Manual override (MO) (for each

1 Pressure gauge (optional)

Note

- pilot solenoid coil, non-detenting or non-detenting/detenting)
- 4 Cover cap for MO, non-detenting
- 5 Cover cap for MO, covered
- 6 Cover cap for MO, non-detenting, heavy-duty, detenting via accessory
- 7 Inscription label holder for valve
- 8 Adjusting screw of optional flow control plate
- 9 Exhaust ports "Valves" (3/5)

- 10 Pilot ports 12 and 14 for supplying external pilot air
- 11 Inscription label holder for sub-base
- 12 Supply port 1 (operating pressure)
- 13 Working ports 2 and 4, for each valve position

Note

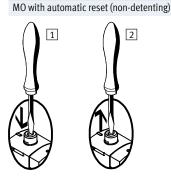

A manually operated valve (manual override) cannot be reset electrically. Conversely, an electrically actuated valve cannot be reset using the mechanical manual override.

- 1 Inscription area and cover for H-rail mounting
- 2 Yellow LEDs: signal status display for pilot solenoid coils
- Power supply connection 3
- 4 Earth terminal
- 5 Fieldbus connection (bus-specific)
- 6 Service interface for handheld unit, etc.
- 7 Red LED: common error display for valves

Key features - Display and operation

Manual override (MO) – Function

- 1 Press in the stem of the manual override using a pointed object
- or screwdriver. The valve is in switching position 2 Remove the pointed object or
- screwdriver. The spring force pushes the stem of the manual override back. The valve returns to its initial position (not with double solenoid valve code J).

Cover cap for MO, with automatic return (non-detenting)

1 Press in the stem of the manual override using a pointed object or screwdriver until the valve switches and then turn the stem clockwise by 90° until the stop is reached.

The valve remains in switching position.

Turn the stem anti-clockwise by 90° until the stop is reached and then remove the pointed object or screwdriver. The spring force pushes the stem of the manual override back. The valve returns to its initial position (not with double solenoid valve code J and D).

Cover caps for manual override

1

Cover cap for MO, non-detenting, heavy-duty, with automatic reset (non-detenting/detenting via accessory)

 Non-detenting: push in key for MO. The valve is in switching position. Detenting:

turn coded key in switching position clockwise through 90° until stop. Valve remains in switching position. In this position the key is latched and cannot be removed.

Turn key anticlockwise through 90° until the stop. The key is now unlatched. The key is pushed out by the spring force of the manual override. The valve returns to its initial position (not with double solenoid valve code J or D).

1 Restricted function, nondetenting: push in the stem of the MO cap using a pointed object or screwdriver. The valve is in switching position.

 Remove the pointed object or screwdriver.
 The spring force pushes the stem of the manual override back.
 The valve returns to its initial position (not with double solenoid valve code J or D).

Cover cap for MO, covered

By covering the cover cap, the MO can be secured against accidental actuation.

- Note

Cover caps for the manual override can be ordered separately as accessories. There are also VSVA valve variants with pre-assembled cover caps.

1) As an example, here the part code for a 5/2-way single solenoid valve, mechanical spring return is used (e.g.: VSVA-B-M52-MZTR-A2-1T1L)

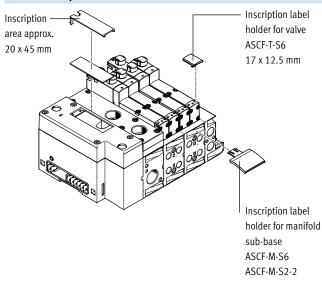

- Note

Cover caps for non-detenting/heavy duty manual override, detenting via accessory, are provided for one-time use only.

In the event of multiple use, reliable locking of the cover cap cannot be guaranteed.

Key features – Electrical components

Identification system

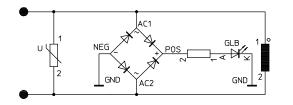

Protective circuit

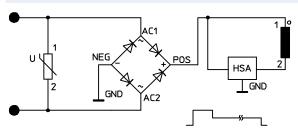

Each VSVA solenoid coil is provided with a spark arresting protective circuit and protected against polarity reversal.

24 V DC version (width 18 to 42 mm)

The 24 V DC version of width 52 mm additionally features integrated holding current reduction.

24 V DC version (width 52 mm)

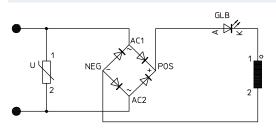

Inscription label holders can be applied to the valves and manifold subbases to identify them. These inscription label holders can be ordered by entering the code B or T in the order code for accessories.

Scope of delivery: inscription label holder including inscription label. The following inscription labels can be used as spares:

- Inscription label holder for valve type ASCF-T-S6: Part No. 540888
- Inscription label holder for manifold sub-base type ASCF-M-S6: Part No. 540889
- Inscription label holder for manifold sub-base (for valve width 52 mm)

Type ASCF-M-S2-2 Part No. 562577 Large inscription labels can be attached to the pneumatic interface as an alternative or in addition to the smaller labels.

110 V AC version (width 18 to 52 mm)

· 🚪 - Note

All control signals of the solenoid coils of a valve terminal share a common load (independent of whether multi-pin, AS-i (actuator-sensor interface) or CPX) is used.

Key features - Electrical components

Individual valve

Valves can also be used on individual sub-bases if actuators are further away from the valve terminal.

- Electrical connection M12, 4-pin 24 V DC
- 4-pin clamped terminal connection for configuration by the user 24 V DC or 110 V AC
- Cable (open end) for configuration by the user 24 V DC or 110 V AC

Individual electrical connection

A maximum of 20 solenoid coils can be actuated. 2 solenoid coils per valve can be addressed.

Individual electrical connection:

- M126-way or 10-way
- 5-pin
- 24 V DC

Electrical multi-pin plug connection

The following multi-pin plug connection variants are offered for the valve terminal VTSA/VTSA-F:

- Sub-D multi-pin plug connection (37-pin for 24 V DC): this valve terminal can be equipped with 1 ... 16 valve positions (with double solenoid valves) or with 1 ... 32 valve positions (with single solenoid valves). A maximum of 32 solenoid coils can be actuated.
- Terminal box (terminal strip for 24 V DC or 110 V AC): this valve terminal can be equipped with 1 ... 16 valve positions (with double solenoid valves), or with 1 ... 32 valve

positions (with single solenoid valves). A maximum of 32 solenoid coils can be actuated.

Multi-pin node (round plug connector): electrical multi-pin plug connection with round plug connector, 19-pin to CNOMO E03.62.530.N, connecting thread M23 for 24 V DC. The valve terminal can be fitted with max. 16 solenoid coils.

The valves are switched by positive or negative logic (PNP or NPN). Mixed operation is not permissible because all control signals of the solenoid coils of a valve terminal share a common load.

Each pin on the multi-pin plug (Sub-D) or terminal box (terminal strip) can actuate exactly one solenoid coil. When using the maximum configurable number of 32 valve positions, 32 valves can be addressed, each with a single solenoid coil. With 16 or fewer valve positions, 2 solenoid coils per valve can be addressed.

- Note

Use the following 37-pin connecting cables from Festo to connect the valve terminal VTSA/VTSA-F with Sub-D multi-pin plug connection: – NEBV-S1W37-...-LE10

- for max. 8 solenoid coils
- NEBV-S1W37-...-LE26
- for max. 22 solenoid coils - NEBV-S1W37-...-LE37
- for max. 32 solenoid coils - NECV-S1W37 plug connector for
- self-assembly

AS-Interface connection

Valve terminals VTSA/VTSA-F with AS-Interface connection can be extended with up to 8 valves with max. 8 solenoid coils.

The valve terminal with AS-Interface connection is based on the same

electrical interlinking module as the valve terminal with multi-pin plug connection.

This means it is possible to convert a valve terminal with multi-pin plug connection using an AS-Interface

module.

The technical specifications of the AS-Interface system must be observed in this case.

- Note

AS-i module VAEM-S6-S-FAS-4-4E. Always operate the AS-i module with additional power supply if 4 solenoid coils (width 52 mm) are simultaneously supplied with current. More information can be found at: → Internet: as-interface

Fieldbus connection/control block

All functions and features of the electrical peripherals CPX are permitted in connection with the CPX interface. This means:

- The valves and electrical outputs are supplied via the operating voltage connection CPX
- The valves are supplied and switched off independently via a separate port on the CPX

- Note

More information can be found at: → Internet: cpx

Key features - Electrical components

Rules for addressing

Address allocation

Address allocation does not depend on whether single- or double solenoid valves are fitted.

Addresses are allocated in ascending order without gaps, from left to right.

Single solenoid valve

A valve position for actuating one solenoid coil (VABV...T1) occupies one address.

Double solenoid valve

A valve position for actuating two solenoid coils (VABV...T2) occupies two addresses. The following assignment applies in this case:

- Coil 14: lower-value address
- Coil 12: higher-value address

Connecting cable

The wire colours refer to the following pre-assembled connecting cables from Festo:

- NEBV-...-LE10 for valve terminal with max. 8 solenoid coils
- NEBV-...-LE26 for valve terminal with max. 22 solenoid coils
- NEBV-...-LE27 for valve terminal with max. 23 solenoid coils
- NEBV-...-LE37 for valve terminal with max. 32 solenoid coils

Pin allocation – Multi-pin, Sub-D socket, 24 V DC; electrical connection code MP1

1 Connector plug M12x1, 5-pin

Note

- Mixed operation of positive-switching (PNP) and negative-switching (NPN) control signals is not permissible because all control signals of the solenoid coils on a valve terminal share a common load.
- All M12 connections (MP2/MP3) on a valve terminal share a common load.

Instructions for use

System equipment

Operate system equipment with unlubricated compressed air if possible. Festo valves and cylinders are designed so that, if used as intended, they will not require additional lubrication and will still achieve a long service life.

The quality of compressed air downstream of the compressor must correspond to that of unlubricated compressed air. If possible, do not operate all of your system equipment with lubricated compressed air. The lubricators should, where possible, always be installed directly upstream of the actuator used. Incorrect additional oil and too high an oil content in the compressed air reduce the service life of the valve terminal.

Use Festo special oil OFSW-32 or the alternatives listed in the Festo catalogue (as specified in DIN 51524 HLP32; basic oil viscosity 32 CST at 40 °C).

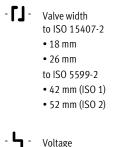

Bio-oils

When using bio-oils (oils which are based on synthetic or native esters, e.g. rapeseed oil methyl ester), the maximum residual oil content of 0.1 mg/m³ must not be exceeded (see ISO 8573-1:2010 Class 2).

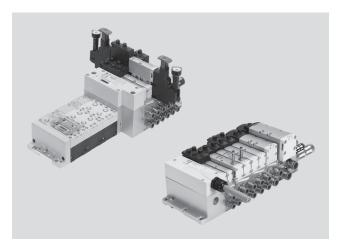

Mineral oils

When using mineral oils (e.g. HLP oils to DIN 51524, parts 1 to 3) or similar oils based on poly-alpha-olefins (PAO), the maximum residual oil content of 5 mg/m³ must not be exceeded (see ISO 8573-1:2010 Class 4). A higher residual oil content irrespective of the compressor oil cannot be permitted, as the basic lubricant would be flushed out over time.

FESTO

Voltage 24 V DC 110 V AC - Flow rate¹⁾ Width 18 mm: up to 550 (700) l/min Width 26 mm: up to 1100 (1350) l/min Width 42 mm: up to 1300 (1860) l/min Width 52 mm: up to 2900 l/min

Approval certificate		BIA
		C-Tick
		c UL us – Recognized (OL) (24 V DC only)
		CSA (OL) ³⁾
CE marking (see		In accordance with EU Low Voltage Directive (only VTSA/VTSA-F-MP, only 110 V AC)
declaration of conformity)		In accordance with EU EMC Directive ¹⁾

1) For information about the applicability of the component see the manufacturer's EC declaration of conformity at: www.festo.com/sp 🗲 User documentation.

If the component is subject to restrictions on usage in residential, office or commercial environments or small businesses, further measures to reduce the emitted interference may be necessary. 2) Solenoid valves with code VC (2/2-way type ... T22C), N (3/2-way type ... T32U), K (3/2-way type ... T32C), H (3/2-way type ... T32H) must not be operated with vacuum; operating pressure is 3 ... 10 bar here

3) Approval certificate is valid for VTSA/VTSA-F-MP, VTSA/VTSA-F-FB

Electrical data – Individual electrical connection

Direction of flow of solenoid valves

Solenoid valves with reversible only flow direction

- These valves must only be operated on pressure zones with reversible supply (3 and 5 with supply pressure 1 as exhaust air) or on a reversible pressure regulator. If necessary create pressure separation zones with duct separation.
- Reversible 3/2-way solenoid valves do not permit the special function "ducted pilot exhaust air"
- Ports 12 and 14 on the end plate variants must be supplied with the same pressure
- Right-hand end plate with pilot air selector: can be realised via position 1 or 2
- Right-hand end plate with threaded connections: 12 and 14 must be supplied with the same pressure level

Solenoid valves with any flow direction

- Valves with any flow direction such as the 5/2-way solenoid valve, code M, for example, are suitable for vacuum operation (standard valves such as the 2x 2/2-way solenoid valve with code VC, for example, may not be used for vacuum operation).
- An exception is the 2x 2/2-way solenoid valve with code VV (T22CV), which only allows vacuum operation at ports 3 and 5. The solenoid valve with code VV (T22CV) cannot be combined with other valve functions; a separate pressure zone is required.

If neither solenoid coil is energised, the valve assumes its mid-position by means of spring force. If both solenoid coils are energised at the same time, the valve remains in the previously assumed switching position.

--Note

When using the solenoid valves VSVA-B-P53AD-...- or VSVA-B-P53BD-...- (terminal code SB or SD) for free venting (1-->2 or 1-->4) in the detenting or mid-position, in the event of an operating pressure

greater than 6 bar, the flow can reduce or drop to 0 l/min. This does not happen if a tube measuring at least 15 cm in length is used at port 2/4.

- **V**alve width to ISO 15407-2 26 mm
- **L** Voltage 24 V DC 110 V AC

- 🚺 - Flow rate Valve width 26 mm: VTSA up to 1100 l/min VTSA-F up to 1350 l/min

Safety characteristics - Valve, width 26 mm

Conforms to standard		EN 13849-1/2
CE marking (see declaration of	110 V AC	To EU Low Voltage Directive
conformity)	24 V DC	In accordance with EU EMC Directive ¹⁾ (only solenoid valves with sensor)
Shock resistance		Shock test with severity level 2, to EN 60068-2-27
Vibration resistance		Transport application test with severity level 2, to EN 60068-2-6

1) For information about the applicability of the component see the manufacturer's EC declaration of conformity at: www.festo.com/sp + User documentation.

If the component is subject to restrictions on usage in residential, office or commercial environments or small businesses, further measures to reduce the emitted interference may be necessary.

Safety characteristics - Valve, width 26 mm, 24 V DC

If neither solenoid coil is energised, the valve assumes its mid-position by means of spring force. If both solenoid coils are energised at the same time, the valve remains in the previously assumed switching position.

Standard nominal flow rate - Valve/valve terminal [l/min], width 26 mm

1) Switching position

2) Mid-position

-- Note

The solenoid valves VSVA-B-P53BD-...-A1-1T1L (terminal code SD) can be operated without restrictions at an operating pressure of less than 6 bar. At an operating pressure of more than 6 bar, the actual flow must not exceed 1900 l/min (e.g. 10-->2 bar) or these

solenoid valves may switch unintentionally (to the mid-position or switching position 14). At high pressures, this can be achieved using a flow control valve/ restrictor, for example. (e.g. a reducing adapter on port 2 or 4 to reduce it from G1/4 to G1/8).

Valve switching times in [ms], width 26 mm, nominal operating voltage 24 V DC/110 V AC

If neither solenoid coil is energised, the valve assumes its mid-position by means of spring force. If both solenoid coils are energised at the same time, the valve remains in the previously assumed switching position.

Standard nominal flow rate - Valve/valve terminal [l/min], width 42 mm

Valve terminals VTSA/VTSA-F, NPT Technical data – Solenoid valve, width 52 mm

- **[]** - Valve width to ISO 5599-2 52 mm (ISO 2)

- Flow rate Valve width 52 mm: VTSA up to 2900 l/min VTSA-F up to 2900 l/min

Safety characteristics - Valve, width 52 mm

Surcey enuracteristics Tut		
Conforms to standard		EN 13849-1/2
CE marking (see	110 V AC	To EU Low Voltage Directive
declaration of conformity)	24 V DC	In accordance with EU EMC Directive ¹⁾
Shock resistance		Shock test with severity level 2, to EN 60068-2-27
Vibration resistance		Transport application test with severity level 2, to EN 60068-2-6

1) For information about the applicability of the component see the manufacturer's EC declaration of conformity at: www.festo.com/sp 🗲 User documentation.

If the component is subject to restrictions on usage in residential, office or commercial environments or small businesses, further measures to reduce the emitted interference may be necessary.

If neither solenoid coil is energised, the valve assumes its mid-position by means of spring force. If both solenoid coils are energised at the same time, the valve remains in the previously assumed switching position.

Valve terminals VTSA/VTSA-F, NPT

Technical data - Solenoid valve with switching position sensing

FESTO

The single solenoid 5/2-way valve with spring return in width 18 mm and 26 mm features valve diagnostics. Designed as a plug-in or individual connection valve with pilot valves to ISO 15218 and square plug type C. The normal position of the piston spool is monitored by the inductive sensor.

This valve is not a safety device in accordance with the Machinery Directive 2006/42/EC. When used in higher categories, the sensor signal from the valve must be evaluated by the control system. This valve is suitable for use in safetyrelated parts of control systems to EN ISO 13849-1. The control block has been developed and manufactured in accordance with the basic and proven safety principles of EN ISO 13849-2. This valve is designed for installation in machines and automation systems and must only be used in industrial applications (high-demand mode).

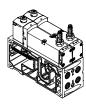

Decentralised individual connection variant

Valve on individual sub-base (square plug or plug-in), with integrated piston position sensing.

The electrical connection is established either via a standardised 4-pin M12 plug 24 V DC (ISO 15407-2), a 4-pin spring-loaded terminal or a cable (open end) 24 V DC/110 V AC, which are configured by the user. The individual sub-base can be supplied with internal or external pilot air depending on the version.

Variant for valve terminal VTSA/VTSA-F

The valves with integrated piston position sensing in plug-in design for valve terminal VTSA/VTSA-F can be used regardless of the type of electrical actuation (individual, multi-pin plug or fieldbus/control block connection).

Pilot air supply:

The valve terminal can be supplied with internal or external pilot air via the various end plate variants.

- Note

Valves in plug-in design always get their pilot air from duct 14 in the manifold sub-base.

1) The circuit symbol represents a valve with a proximity sensor with switching output signal with an N/O contact. In accordance with ISO 1219-1, this symbol applies to both N/O contacts and N/C contacts. The switching element function of the sensors used here is designed as an N/C contact.

┘ F Note Pilot exhaust air po

Pilot exhaust air port 12 vents directly at the valve, without a connection.

If the customer requests a "turned seal", exhaust air is vented at the end plates of the valve terminal, which does not conform to the ISO standard.

Safety characteristics		
Conforms to standard	EN 13849-1/2	
CE marking	n accordance with EU EMC Directive ¹⁾	
(see declaration of conformity)		
Shock resistance	Shock test with severity level 2, to EN 60068-2-27	
Vibration resistance	Transport application test with severity level 2, to EN 60068-2-6	

For information about the applicability of the component see the manufacturer's EC declaration of conformity at: www.festo.com/sp → User documentation.
 If the component is subject to restrictions on usage in residential, office or commercial environments or small businesses, further measures to reduce the emitted interference may be necessary.

- Note

-

• The sensors contained in the valves must not be replaced by the customer. Incorrect assembly can result in malfunctions or damage to the valve. Return the module to Festo for repair in the event of a fault.

• Valves with switching position sensing from the series VSVA-B-M52-... can only be ordered individually. If these are used on a valve terminal, appropriate vacant positions must be provided for them. Exceptions are the two valves with ident. code SS, SO and SQ.

Valve terminals VTSA/VTSA-F, NPT

Technical data - Control block with safety function

FESTO

Voltage
 24 V DC

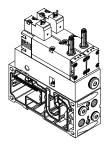

<image>

Description

The control block is designed for twochannel actuation of pneumatic drive components such as double-acting linear cylinders, for example, and can be used to realise the following protective measures:

- Protection against unexpected start-up (EN 1037)
- Reversing hazardous movements, provided the reversing motion will not result in further hazards

Version for valve terminal VTSA/VTSA-F

The control block has attributes for that enable Performance Level e to be achieved for the safety measures. The control block has been developed and manufactured in accordance with the basic and proven safety principles of EN ISO 13849-1 and EN ISO 13849-2.

The valves with integrated piston

position sensing on manifold sub-

base for valve terminal VTSA/VTSA-F

need to be supplied with electrical

power regardless of the type of elec-

trical actuation (individual, multi-pin

plug or fieldbus/control block

connection).

The requirements of EN ISO 13849-1 and EN ISO 13849-2 (e.g. CCF, DC) must be taken into consideration for implementation and operation of the component and for use in higher categories (2 to 4).

When using this product in machines or systems subject to specific C standards, the requirements specified in these standards must be observed. The control block with safety function is designed for installation in machines and automation systems and must only be used in industrial applications (high-demand mode). The control block with safety function is suitable for use as a press safety valve to EN 962.

More information and technical data → Internet: user documentation

The electrical connection for the solenoid valves is established separately via a standardised square plug to EN 175301-803, type C. The piston position sensing feature of the inductive PNP or NPN proximity sensor is realised using a push-in connector in the size M8x1 to EN 61076-2-104.

- Note

The control block with safety function (VOFA) is also available as a decentralised individual connection variant with electrical and pneumatic

- Note

The appropriate manifold sub-base VABV-S4- ..., which is required for integration into the valve terminal, is not part of the control block. It is automatically allocated by the configurator on selection of the control block.

individual connection. For information see: → Internet: vofa

Technical data – Control block with safety function

Pneumatic/electrical interlinking

Function

The safety function is achieved through two-channel pneumatic interlinking of two 5/2-way single solenoid valves within the control block: port (4) is only pressurised if both solenoid valves are switched to switching position (14). Port (2) is always pressurised if at

least one of the two solenoid valves is

Circuit symbol¹⁾

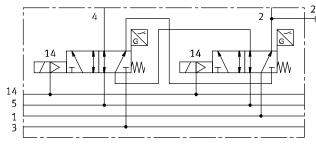

in normal position. The valve is reset via a mechanical spring.

The switching operation of the solenoid valves can be monitored by sensing via the proximity sensors at the solenoid valves (switching position sensing). This is done by means of a logic operation of the control signal and the signal change of the proximity sensor to check whether the piston spools of the solenoid valves are reaching or leaving the normal position (expectations).

The piston spools of the solenoid

valves are designed so that pneumatic short circuits between ports (2) and (4) are ruled out (overlap).

The two solenoid valves must be actuated via two separate ducts to achieve the desired category 4 (Performance Level e, to EN ISO 13849-1).

For the control block with safety function VOFA-B26-T52-... for the valve terminal, there is two-channel pneumatic interlinking of two 5/2-way solenoid valves, width 26 mm, with the intermediate plate as vertical stacking (output 2 is switched in parallel, output 4 is switched in series).

The circuit symbol represents a valve with a proximity sensor with switching output signal with an N/O contact. In accordance with ISO 1219-1, this symbol applies to both N/O contacts and N/C contacts. The
switching element function of the sensors used here is designed as an N/C contact.

Technical data - Pilot air switching valve, width 18 mm, 26 mm

Description

The pilot air switching valve is essentially a combination of a 5/2-way solenoid valve with switching position sensing and the intermediate plate VABF-S4-...-S. It enables verifiable switching on and off (sensor function) of the pilot air supply from duct 1 to 14 for the entire pressure zone or

Alternative switching position sensing with pressure switch

valve terminal.

This valve is not a safety device in accordance with the Machinery Directive 2006/42/EC. When used in higher categories, the sensor signal from the valve must be evaluated by the control system.

This valve is suitable for use in safetyrelated parts of control systems to EN ISO 13849-1. This valve is designed for installation in machines and automation systems and must

only be used in industrial applications (high-demand mode). More information and technical data → Internet: user documentation

		- 🛔 - Note	

The pilot air switching valve can only be operated on the valve terminal VTSA/VTSA-F in combination with a right-hand end plate for external

pilot air type VABE-S6-1RZ-... . Port 14 on the right-hand end plate must be sealed for this.

Vertical stacking variant for valve terminal VTSA/VTSA-F, width 18 mm, 26 mm

The valves with integrated piston position sensing in plug-in design for valve terminal VTSA/VTSA-F can be used regardless of the type of electrical actuation (individual, multi-pin plug or fieldbus/control block connection). This module is supplied preassembled together with the valve terminal VTSA/VTSA-F. No other assembly steps are required before installation. The piston position sensing feature is realised by means of an inductive PNP proximity sensor with cable and

to EN 61076-2-104. Alternatively, combinations with the

push-in connector in the size M12x1

pressure switch in the intermediate plate and ISO solenoid valves are possible.

Note

All solenoid valves VSVA to ISO 15407-1 can be used.

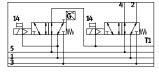

➔ Internet: vsva

The circuit symbol represents a valve with a proximity sensor with switching output signal with an N/O contact. In accordance with ISO 1219-1, this symbol applies to both N/O contacts and N/C contacts. 1) The switching element function of the sensors used here is designed as an N/C contact.

Data sheet – Pilot air switching valve, width 18 mm, 26 mm

Function – Pneumatic/electrical interlinking

The function for switching off the pilot air is essentially achieved by combining the intermediate plate type VABF-S4-...-S with the 5/2-way single solenoid valve type VSVA-B-M52-MZD-...-1T1L-APX-0,5. The valve terminal is not supplied with any pilot air via the right-hand end plate type VABE-S6-1 (ident. code XS, external pilot air). Port 14 on the end plate is sealed.

The pilot air for the valve is branched from duct (1) in the intermediate plate

and redirected to the pilot air duct (14) of the valve terminal when the valve is in the switching position. Ports (2) and (4) of the manifold subbase are sealed with blanking plugs. The switching operation of the solenoid valve can be monitored by sensing via the proximity sensor in the solenoid valve (or pressure switch in the intermediate plate VABF...).

This is done by means of a logic operation of the control signal and the signal change of the proximity sensor to check whether the piston spools of the solenoid valves are reaching or leaving the normal position (expectations).

The piston spool of the solenoid valve is designed so that pneumatic short circuits between ports (2) and (4) are ruled out (overlap).

Alternatively, combinations with the pressure switch in the intermediate plate and ISO solenoid valves are possible.

- 📲 - Note

A valve from the VTSA/VTSA-F modular system can be planned or configured to the right of the valve with piston position sensing on the intermediate plate of the pilot air switching valve.

Pilot air switching valve with integrated piston position sensing The pilot air switching valve can be ordered as a combination of a 5/2-way solenoid valve with switching position sensing and the intermediate plate VABF-S4-...-S. Alternative switching position sensing with pressure switchAs an alternative to the pilot airVarious 5/2-way sswitching valve with integrated pistonavailable in combposition sensing, a combination ofsure switch SPBAISO solenoid valve and pressureswitch in the intermediate plate is

Various 5/2-way solenoid valves are available in combination with a pressure switch SPBA-... for this purpose.

Note -

Further solenoid valves with switching position sensing can be ordered as distinct types. These are preconfigured with the required MO

cover caps.

→ Solenoid valve with switching position sensing page 140

Note -

The sensors contained in the valves must not be replaced by the customer. Incorrect assembly can

result in malfunctions or damage to the valve. Please contact Festo in the event of a malfunction.

Technical data - Soft-start valve, width 43 mm

Function 11 Flow rate Without sensor Pressurisation: 3000 l/min (14)4 |2(1)Exhausting: 3300 l/min ·ΓJ Module width 12/14 72 43 mm With sensor Temperature range (14)4 |2(1) −5 ... +50 °C 0 Operating pressure łw 2 ... 12 bar 12/14 72

Description

Function

The purpose of the soft-start valve is to slowly and safely build up the supply pressure in duct 1 of the valve terminal or to quickly exhaust it. Switch-on takes place in two stages:

- First the working pressure for duct 1 gradually increases (the speed can be adjusted using a flow control screw).
- Once the working pressure in duct 1 reaches a previously set value, the soft-start valve switches to full operating pressure at duct 1 of the valve terminal.

The switching point for full operating pressure is set to 4 bar at the factory, but can be changed using an adjusting screw.

The full operating pressure is applied to duct 14 (pilot air) at all times. This pressure causes the valves on the valve terminal to immediately move to the required switching position; no undefined status is possible. Duct 1 of the valve terminal is exhausted via the soft-start valve's exhaust port only in the normal position, when the valve is not switched. The exhaust air can optionally be ducted with a QS fitting or using a silencer.

A detenting manual override with selfreset via an electrical control signal is available for maintenance and service purposes.

		 Determine the second sec	activation of the manual override (MO) must be guaranteed in all operating modes.
soft-start a sensor y. This	switched and thus whether the valve terminal is being supplied with air. Pressure sensing via a pressure gauge	The soft-start valve can optionally be ordered with a sensor. Due to the cal- ibration that is required, there is no	of a sensor. Connecting cables with integrated LED display are provided for displaying the

Diagnostics

The piston position of the soft-start valve can be monitored by a sensor with integrated LED display. This sensor registers whether the valve has

Pilot air supply

The valve terminal can either be supplied with internal pilot air via the soft-start valve or with internal or external pilot air via the various end plate variants. The pilot air supply for the valve terminal (internal/external) is determined by the seal between the

manifold sub-base and the soft-start

(optional) is also possible.

valve.

The scope of delivery of the soft-start valve includes both the seal for internal pilot air supply (with hole) and the seal for external pilot air supply

provision for subsequent retrofitting

(without hole). The soft-start valve itself always has internal pilot air supply.

signal status.

the valve terminal or of a pressure zone. Technical data – Soft-start valve, width 43 mm

FESTO

Example 1: Pressure zone with soft-start valve and pilot air supply

Internal, external pilot air supply

Requirements

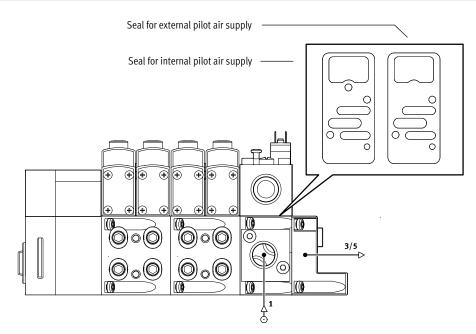

- Compressed air supply via soft-start valve
- Right-hand end plate¹): blanking plug in duct 1

For internal pilot air supply:

- Seal (soft-start valve manifold sub-base) with pilot air supply hole "open" and
- Right-hand end plate: blanking plug in duct 14

For external pilot air supply:

- Seal (soft-start valve manifold sub-base) with pilot air supply hole "closed" and
- Pilot air supply via duct 14 in the right-hand end plate

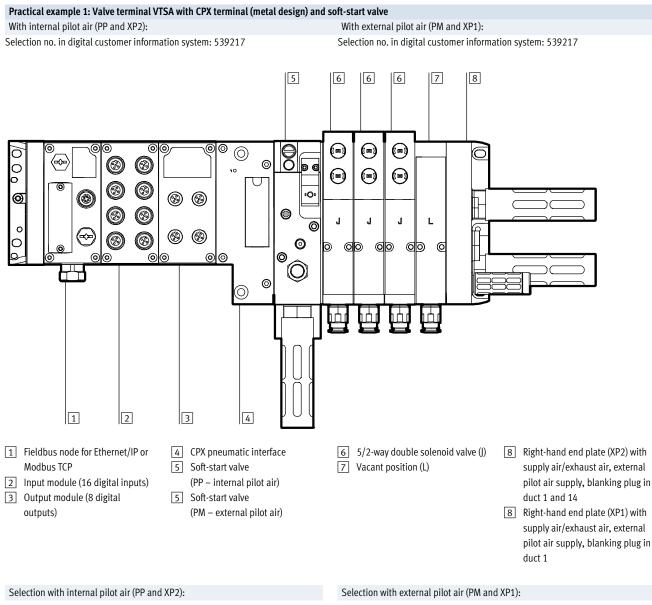

1) With this configuration, a right-hand end plate with pilot air selector is not possible, as it does not allow the discharge of exhaust air

Example 2: Pressure zone with soft-start valve, supply plate and pilot air supply Internal, external pilot air supply Requirements • Compressed air supply via soft-start Seal for external pilot air supply valve • Supply plate: blanking plug in duct 1 Seal for internal pilot air supply • Right-hand end plate: blanking plug in duct 1, 3, 5 or • Right-hand end plate with pilot air selector For internal pilot air supply: • Seal (soft-start valve - manifold sub-base) with pilot air supply hole "open" and • Right-hand end plate: blanking **(+** (4 ÷. plug in duct 14 or • End plate with coding (position 2, internal pilot air supply) For external pilot air supply: • Seal (soft-start valve - manifold sub-base) with pilot air supply hole "closed" and ₹ J • Pilot air supply via duct 14 in the right-hand end plate or

2019/05 - Subject to change

• End plate with coding (position 1, external pilot air supply)

Selection no. in the digital customer information system: 539217 Electrical part: 51E-F36GCQPNMKBLX-S+GSBA Pneumatic part: 44P-N-XP1-SMPM-BB3JL+UGBP1

Practical example 2: Valve terminal VTSA with CPX terminal (metal design), soft-start valve and switching position sensing

With external pilot air (PM and XP2):

Selection no. in digital customer information system: 539217

Selection with external pilot air (PM and XP2), solenoid valve with switching position sensing (SS) and intermediate plate for switchable pilot air supply (ZO)

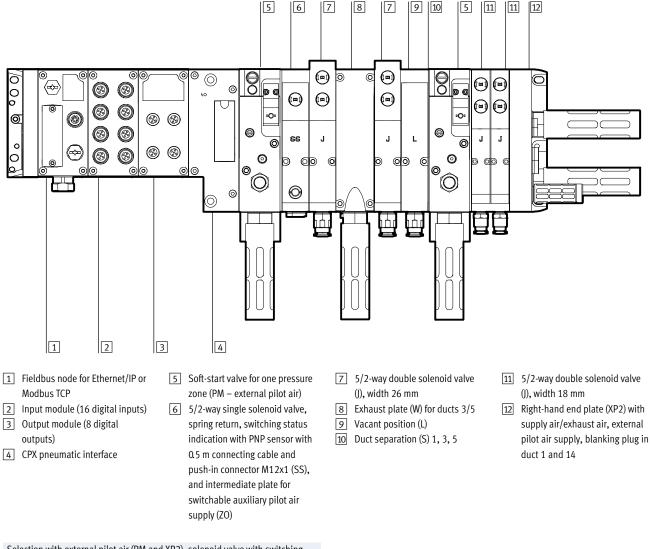

Selection no. in the digital customer information system: 539217 Electrical part: 51E-F36GCQPNMKBLX-S+GSBA

Pneumatic part: 44P-N-XP2-SMPM-BB-SSZOJJL+UGCGBP1

Practical example 3: Valve terminal VTSA with CPX terminal (metal design), switching position sensing, soft-start valve and 2 pressure zones

With external pilot air (PM and XP2):

Selection no. in digital customer information system: 539217

Selection with external pilot air (PM and XP2), solenoid valve with switching position sensing (SS) and intermediate plate for switchable pilot air supply and 2 pressure zones

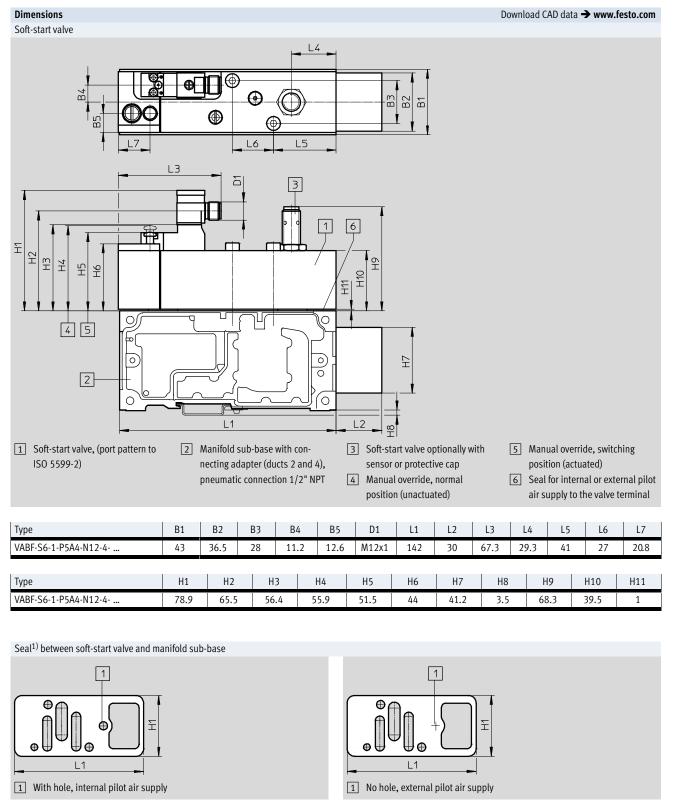

Selection no. in the digital customer information system: 539217 Electrical part: 51E-F36GCQPNMKBLX-S+GSBA Pneumatic part: 44P-N-XP2-LSMPM-BWBSPMA-SSZOJJLJJ+UGCGBP1

Electrical connection of pneumatic components

The solenoid valve with switching position sensing (SS), with sensor connection M12 is connected to the CPX input module using an appropriate connecting cable in order to link the sensor signal into the CPX system. The soft-start valve (PM - with sensor PNP) is connected to the CPX input module using an appropriate connecting cable (GC) in order to link the sensor signal into the CPX system.

A connecting cable (GBP1) to/from the CPX output module is used to control the soft-start valve (PM). (Control signal)

Technical data – Vacuum block

Description

The vacuum block can be integrated into the existing valve terminal VTSA/ VTSA-F. To do this, the vacuum block is screwed to a manifold sub-base for 2 valve positions, width 26 mm. The vacuum block is used in conjunction

with a suction gripper to pick up, hold and place components. Picking up and holding is carried out by means of a vacuum by a suction gripper. Once the component has been positioned,

it is released by an an ejector pulse. This ejector pulse is created by pressurising the vacuum system so that the vacuum briefly breaks down. The ejector pulse is adjustable.

Note

The vacuum block VABF-S4-1-V2B1 can be operated in combination with the vertical stacking for pilot air switch-off (intermediate plate VABF-S4-1-S plus 5/2-way valve) on the valve terminal VTSA.

Function

The intended use of the vacuum block VABF-S4-1-V2B10 ... is to generate a vacuum. The generated vacuum and a suction gripper produce a force by means of which a workpiece can be gripped and transported. The supply of compressed air for vacuum generation is controlled by a solenoid valve. The vacuum is generated by actuating solenoid coil 12.

The setpoint value set at duct B for the generated vacuum is monitored via a vacuum sensor (with switching output). Vacuum generation reverts to a self-latching loop phase after reaching the set reference value. The vacuum block controls the vacuum generation process independently within the range of the set switching points (air-saving function).

The integrated solenoid valve is used to generate an ejector pulse by activating coil 14. The workpiece is thus safely released from the suction and the vacuum is rapidly broken down. The length of the ejector pulse can be influenced by the duration of the electrical pulse. The strength of the ejector pulse is influenced by the adjustable flow control valve.

Note

In the absence of electric or pneumatic supply when the valve is in the "create vacuum" or "air saving" state, the valve reverts to the "generate vacuum" position.

Operating mode of the air-saving function (LS)

If the desired threshold value (1) (turn off suction) is reached for the vacuum, vacuum generation is automatically switched off. Non-return valves

prevent the reduction of the vacuum. Nonetheless, leakage (e.g. due to rough workpiece surfaces) will slowly

Threshold value to switch off suction (air-saving function) (1):

The manifold sub-base for use with the vacuum block can only be ordered via the valve terminal configurator and therefore does not have a separate part number.
 Code letter within the order code for a valve terminal configuration.

Adaptation to width 65 mm

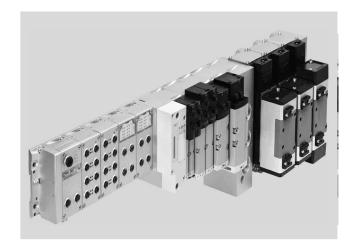

Operating pressure -0.9 ... 10 bar

Voltage

24 V DC

Temperature range −5 … +50 °C

Description Function

The adaptation of valves, regulator and flow control plates of width 65 mm, ISO size 3 in type 04

technology further expands the scope of application of the valve terminal VTSA/VTSA-F:

- 5 valve sizes with pneumatic function integration on a valve terminal VTSA/VTSA-F.
- Max. flow rate up to 4,000 l/min.
- Max. 26 solenoid coils of width 65 mm, ISO size 3 can be adapted to the valve terminal VTSA/VTSA-F. The total number of solenoid coils of all widths must not exceed 32.

Restrictions

End plate with pilot air selector

If components of ISO size 3 are used, the end plate with pilot air selector is not available for selection.

Pilot air supply via adapter plate

If no pneumatic components are installed on the left-hand side of the adapter plate (electrical components only), ducts 12 and 14 of the adapter plate must be sealed with blanking plugs.

Pressure zones

Max. 2 pressure zones are possible with ISO size 3.

Key features - Adaptation to width 65 mm

Equipment options

- Double solenoid

• 5/2-way valve

Valve functions for width 65 mm, ISO size 3

- 5/3-way valve - Mid-position pressurised - Single solenoid, pneumatic
 - Mid-position closed
 - Mid-position exhausted
- Double solenoid with dominant signal

spring/mechanical spring

Special features

- Fieldbus connection/CPX terminal
- Max. 32 valve positions/ max. 32 solenoid coils
- Any compressed air supply
- Any number of pressure zones
- Max. 32 valve positions/ max. 32 solenoid coils
- Parallel modular valve linking

Multi-pin plug connection

• Any compressed air supply

• Any number of pressure zones

AS-Interface

• 1 to 8 valve positions/max. 8 solenoid coils. Auxiliary power supply is required.

Combinable

- Width 65 mm: valve flow rate up to 4000 l/min
- Width 18 mm, 26 mm, 42 mm and 52 mm can be combined on a single valve terminal. Width 65 mm is mounted at the end of the VTSA/ VTSA-F configuration via adapter VABA

Note

The total number of solenoid coils of all widths must not exceed 32.

Valve terminal configurator

A valve terminal configurator is available to help you select a suitable VTSA/VTSA-F valve terminal. This makes it much easier to order the right product.

The valve terminals are fully assembled according to your order specification and are individually checked. This reduces assembly and installation time to a minimum.

Order a valve terminal VTSA using the order code:

Ordering system for VTSA → Internet: vtsa

Ordering system for CPX → Internet: cpx

→ Internet: www.festo.com

Order a valve terminal VTSA-F using the order code:

Ordering system for VTSA-F → Internet: vtsa-f

Ordering system for CPX → Internet: cpx

Note -

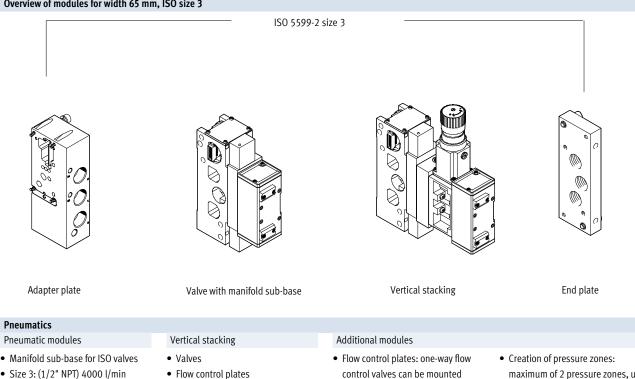

Please note that despite the basic configuration for ISO size 3 valves

- the manual override is always non-detenting
- exhaust air 3/5 of the adapter plate for ISO size 3 is always routed separately
- there is no option for 90° connection plate, outlet at bottom
- there is no option for sintered silencers
- there is no option for pneumatic accessories

Peripherals - Pneumatic components, width 65 mm

FESTO

- Adapter plate
- Pressure supply connection duct 1
- Exhaust connection duct 3/5 (separated)
- External pilot air supply connection (optional) for pneumatic components on the left-hand side

Pneumatic modules

- Manifold sub-base for one ISO valve
- Pilot control via intermediate solenoid plate
- ISO size 3

- · Flow control plates • Intermediate pressure regulator plates
- Pressure gauge
- Creation of pressure zones with 10 bar or vacuum (with external pilot air supply only)

Information on valve activation for ISO size 3

- All intermediate solenoid plates feature a non-detenting manual override
- Valve terminals with internal pilot air supply: restricted pressure range
- Valve terminals with external pilot air supply: pressure zones up to 10 bar or vacuum operation possible. In this case, the pilot air supply must be regulated and supplied externally.

between the manifold sub-base and the valve so that the speed of travel can be set separately for single and

- double-acting cylinders • Pressure regulators: intermediate pressure regulator plates for setting the contact pressure of a cylinder, either separately on duct 1, 2 or 4, or shared by 2 and 4
- Pressure gauge on pressure regulator

Flexible compressed air supply

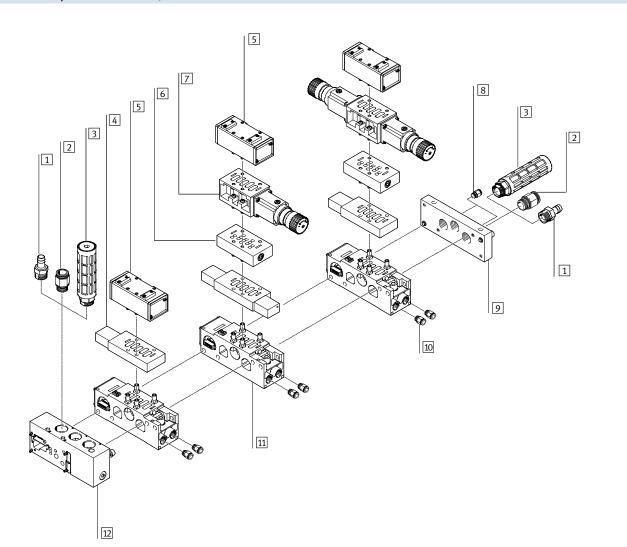

- Compressed air supply via the adapter plate or the right-hand end plate
- With large valve terminals, compressed air can be supplied at both sides

- maximum of 2 pressure zones, up to 10 bar as well as for vacuum, are possible for all valve sizes. Compressed air supply at both sides is essential in this case
- Regulated external pilot air supply should be used for pressures < 3 bar

Options

- Vacant positions for subsequent extensions
- All pneumatic connections can also be supplied with a G thread

Valve terminals VTSA/VTSA-F, NPT Key features – Pneumatic components, width 65 mm

Key features – Pneumatic components			
Adapter plate VABA			
	The adapter plate VABA is used for adapting of valves of width 65 mm ISO size 3 to valve terminal VTSA/VTSA-F. Connections for supply/exhaust air	and pilot air supply are available. The external pilot air used here sup- plies the valve terminal with valves of width 18 52 mm on the left-hand	side of the adapter. The external pilot air supply for the valves with a width of 65 mm, ISO siz 3 is provided via the end plate IEPR
Blanking plates			
000	Blanking plates are used to seal off vacant valve positions. No intermediate solenoid plate is	mounted underneath the blanking plate. This depends on the valve used and must be ordered with the valve if	the terminal is extended at a later date.
Valves and pilot control			
	The valves used are pneumatically actuated standard valves that are controlled by means of an intermedi- ate solenoid plate.		
Valves and flow lines			
he selection of pilot air supply is nade at the intermediate solenoid olate by configuring two plugs. Air can	be taken from the supply air, or from a separate air supply. A separate pilot air supply is required in principle if	supply pressure is less than 3 bar (including vacuum). In this case it is advisable to restrict	the pilot air supply to max. 10 bar with a suitable regulator.

Valve terminals VTSA/VTSA-F, NPT Key features – Pneumatic components, width 65 mm

FESTO

The following circuit symbols are shown as solenoid valves and are the combination (set) consisting of pneumatic valve with corresponding intermediate solenoid plate. The symbols printed on the components can therefore vary.

L	0 0 0		Blanking plate					

- Note

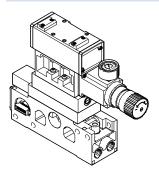

-

A filter must be installed upstream of valves operated in vacuum mode. This prevents any foreign matter in the

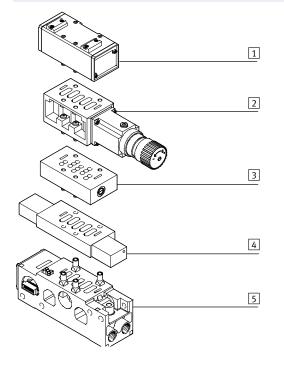

intake air getting into the valve (e.g. when operating a suction cup).

Key features – Pneumatic components, width 65 mm

Vertical stacking, width 65 mm

Vertical stacking components

Additional components can be added to each ISO size 3 valve position between the sub-base (manifold subbase) and the valve. These functions are known as vertical stacking modules and enable special functioning or control of an individual valve position.

1 Valve ISO size 3

- 2 Intermediate pressure regulator plate
- 3 Flow control plate
- 4 Intermediate solenoid plate
- 5 Manifold sub-base with port pattern to DIN ISO 5599-2

Certain combinations are not possible due to the design of the individual vertical stacking components.

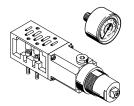

Key features – Pneumatic components, width 65 mm

Flow control plate, width 65 mm

Intermediate plate with integrated exhaust air restrictors at ports 3 and 5 for regulating cylinder speed.

Intermediate pressure regulator plate and pressure gauge, for width 65 mm

Intermediate plate with integrated pressure regulator for regulating pressure at

- Ports 2 and 4 (B, A)
- Port 4 (A)
- Port 2 (B)
- Port 1 (P)

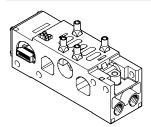

Easy pressure adjustment

Pressure gauges can be screwed directly into the intermediate pressure regulator plate to adjust the pressure.

T		_	Pressure gauge for regulator, max. 10 bar
-		-	Pressure gauge for regulator, max. 16 bar

Key features – Pneumatic components, width 65 mm

Manifold sub-base for valves, width 65 mm

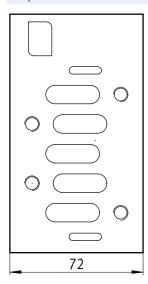

Adaptation to size 65 mm ISO size 3 is based on a modular system which consists of manifold sub-bases and valves. The manifold sub-bases contain a duct seal and an electrical interlinking module, are screwed together and thus form the support system for the valves. Inside the manifold

sub-bases are the connection ducts for supplying compressed air to and exhausting from the valves on the terminal as well as the working ports for the pneumatic cylinders for each valve.

Each manifold sub-base is connected to the next using two screws.

Individual valve terminal sections can be isolated and further manifold subbases inserted by loosening these screws. This ensures that the valve terminal can be rapidly and reliably extended, even for width 65 mm, ISO size 3.

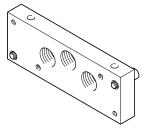

Port pattern to ISO 5599-2 of the manifold sub-base for valves with width 65 mm

Key features - Pneumatic components, width 65 mm

Compressed air supply and exhausting

Right-hand end plate

With the adaptation to width 65 mm ISO size 3, compressed air is supplied via the right-hand end plate and/or the adapter plate VABA Exhausting is via silencers or ports for ducted exhaust air on the adapter plate VABA ... and/or on the righthand end plate. The external pilot air supply for the valves with a width of 65 mm, ISO size 3 is provided via the end plate IEPR

Pilot air supply

When using valves with a width of 65 mm, the internal/external pilot air supply for the valves with a width of 18 ... 52 mm is provided via the adapter plate VABA-.... The external pilot air supply for the valves with a width of 65 mm is provided via the right-hand end plate IEPR

Internal pilot air supply

Internal pilot air supply can be selected if the working pressure is between 3 ... 10 bar.

The pilot air supply is then branched from the compressed air supply 1 using an internal connection. Ports 12 and 14 on the right-hand end plate are sealed with a blanking plug.

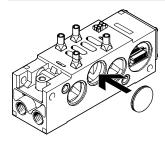

External pilot air supply

If the working pressure is not within the range from 3 ... 10 bar, you must operate the valves with a width of 65 mm, ISO size 3 using external pilot air supply. The pilot air supply is then supplied via ports 12 and 14 on the right-hand end plate.

📲 - Note

If a gradual pressure build-up is required in the system by means of an external soft-start valve, then external pilot air should be selected whereby the pilot pressure is already applied at the point of switch-on.

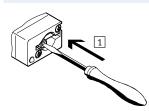

Creating pressure zones

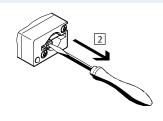

Different supply pressures are possible in the area containing the valves with a width of 65 mm by installing isolating discs between two manifold blocks. When doing this it should be noted that the isolating disc is inserted into the manifold sub-base from the right. The supply and exhaust is effected on the left-hand side via the adapter plate VABA ... and via the right end plate. Usually, only duct 1 has to be isolated. In special cases, isolating discs may also be inserted into exhaust ducts 3 and 5.

Manual override (MO)

MO with automatic reset (non-detenting)

1 Press in the stem of the manual override using a pointed object or screwdriver. The valve is in switching position.

 Remove the pointed object or screwdriver.
 The spring force pushes the stem of the manual override back.
 The valve returns to its initial

position (not with double solenoid valve code J, D).

Key features – Electrical components, width 65 mm

Electrical connection concept

Replacing the solenoid coil fuse

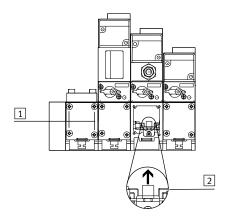

Each solenoid coil is protected with a (fast-blowing) 0315 A fuse. These fuses are located behind the cover of

each manifold sub-base on the printed circuit board. Each single solenoid manifold sub-base has one fuse, while each double solenoid manifold sub-base has two fuses.

- Note

Make sure that there is sufficient clearance for maintenance purposes.

Changing the solenoid coil fuse

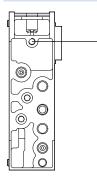

- 1 Loosen the fastening screws in the cover
- 2 Carefully remove the fuse from its base.

Right fuse for valve solenoid 14 Left fuse for valve solenoid 12

1

Key features – Assembly, width 65 mm

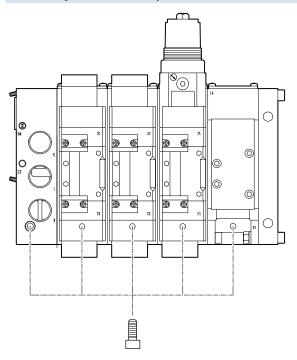

Rear side mounting

1 Blind hole for rear side mounting

The rear side of the manifold subbases has holes (blind holes) for mounting the valve terminal on machines or metal racks (rear side mounting). M8 threads need to be cut for this purpose.

Wall mounting in the area of the adaptation to width 65 mm, ISO size 3

- With screws M8 on the adapter plate and the manifold sub-bases
- Holes (blind holes) on the underside of the manifold sub-bases
- Hole (through-hole) in the adapter plate

- Note

The mounting holes of every second manifold sub-base must be used for

the wall mounting of a valve terminal VTSA-ASI in size ISO 3.

1) If neither solenoid coil is energised, the valve assumes its mid-position by means of spring force.

If both solenoid coils are energised at the same time, the valve remains in the previously assumed switching position.
