

## Adsorption dryers PDAD

**FESTO**

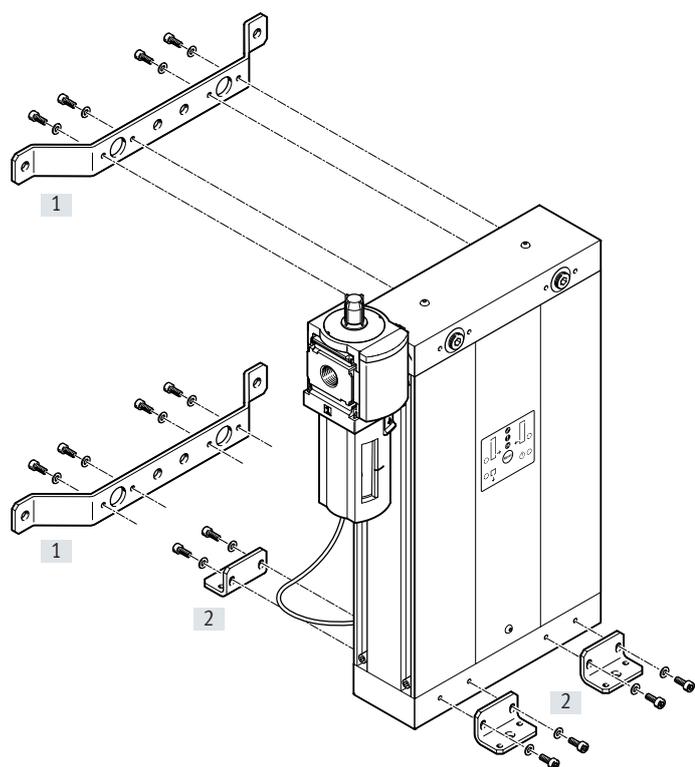

## Key features

Description	Areas of application	Features/advantages/benefits	
<p>Cold-regenerating adsorption dryer with defined pressure dew point and high flow rate for decentralised compressed air drying.</p> <p>Adsorption dryers are always required when pressure dew points of less than <math>-20^{\circ}\text{C}</math> need to be achieved reliably.</p>	<ul style="list-style-type: none"> <li>• Sensors</li> <li>• Semiconductor manufacturing</li> <li>• Manufacture of foils and packaging</li> <li>• Transportation of powder</li> <li>• Dental technology</li> <li>• Painting systems</li> <li>• Food industry</li> <li>• Pharmaceuticals</li> </ul>	<ul style="list-style-type: none"> <li>• The solution for dry and clean compressed air</li> <li>• Extends the service life of pneumatic components</li> <li>• Pressure dew point <math>-40^{\circ}\text{C}</math> or <math>-70^{\circ}\text{C}</math> (with reduced flow rate)</li> <li>• Additional filtering of oil and particulates</li> <li>• Ideal for decentralised compressed air drying</li> </ul>	<ul style="list-style-type: none"> <li>• High flow rate performance of up to 2400 l/min</li> <li>• Selectable voltage for electrical connection</li> <li>• Low purge air consumption and noise levels</li> <li>• Complies with air purity class at the output up to 2:1:2 in accordance with ISO 8573-1:2010 at a pressure dew point of <math>-70^{\circ}\text{C}</math>.</li> </ul>
Save costs	Reduced maintenance costs	Flexible fitting	User-friendly
<p>Controlled, decentralised drying directly at the consuming device is advantageous because only the actually required amount of dry compressed air is prepared. This reduces energy costs, and prevents corrosion, thus extending the service life of components.</p>	<p>Complete cartridges containing drying agent allow quick and easy replacement of the drying agent. Pre-filled cartridges guarantee fast and clean cartridge replacement.</p> <p>Maintenance costs are reduced because the integrated secondary filter (grade of filtration <math>1\ \mu\text{m}</math>) in every cartridge retains the abraded particles of the drying agent.</p>	<p>Space-optimised and flexible mounting thanks to the integrated secondary filter.</p>	<p>A clear operating display shows drying cycles and service functions.</p>
Function	Information		
<p>The air stream is passed through the supplied prefilter, a micro filter with grade of filtration <math>0.01\ \mu\text{m}</math>. It protects the drying agent from contaminating dirt and oil particles (oil significantly reduces the service life of the drying agent). The adsorption dryer consists of two cartridges (four in the case of the PDAD-100) filled with drying agent. Moist compressed air flows through the two cartridges alternately, and the water from the air accumulates on the surface of the drying agent. After a predetermined period of time, the flow of</p>	<p>air is switched to the other cartridge and a portion of the dried air (purge air) is used to regenerate the drying agent in the first cartridge. The purge air escapes into the atmosphere.</p>	<p>The drying agent has a service life of 12000 operating hours.</p> <p>The average purge air requirement under nominal conditions (<math>7\ \text{bar}/25^{\circ}\text{C}</math>) is approx. 17%. If the dryer is used under different operating conditions, the input air/purge air ratio may change as the purge air consumption is only dependent on the input pressure and not on the used output flow rate.</p> <p>The volume of purge air must therefore be adapted to different input pressures by exchanging the air nozzle (air nozzle</p>	<p>set with 3 air nozzles ADNA → page 9).</p>

## Data sheet

Materials	
Housing	Wrought aluminium alloy
Note on materials	RoHS-compliant

 **Note**

Please do not use the average consumption values (flow rate) as your guide when setting up the dryer, instead use

- the input pressure of the dryer,
- the peak value for the flow rate and
- the maximum permissible supply temperature.

The adsorption dryers are designed for continuous operation. Intensely pulsed or intermittent operation leads to premature ageing of and/or damage to the drying agent and thus to failure of the dryer. If the adsorption dryer PDAD is nonetheless to be used in pulsed or intermittent mode, the use of buffer reservoirs, through which the compressed air flows, is recommended for smoothing the pressure peaks.

Depending on the application these can be mounted upstream and/or downstream of the dryer. The volume of a reservoir should be approx. 50% of the flow rate for one minute.

 **Note**

On delivery the adsorption dryer PDAD is configured with an air nozzle for an input pressure of 7 ... 9 bar. If a different input pressure is used, the air nozzle must be exchanged. The set containing alternative air nozzles must be ordered separately as an accessory → page 9.

**Nominal flow rate  $q_n$  [l/min] for pressure dew point  $-40^\circ\text{C}$  (temperature of medium at input  $25^\circ\text{C}$  saturated)**
