Vacuum generators VADM/VADMI

Key features

FESTO

Product overview

Vacuum
generators

All Festo vacuum generators have a single-stage design and operate according to the Venturi principle. The product series described below

have been designed for a wide range of applications. The different performance classes of the individual product families make it possible to select

vacuum generators tailored to suit the specific requirements of each application.

Standard and inline ejectors

VN

Technical data ➔ Internet: vn

- Nominal width 0.45 ... 3 mm
- Max. vacuum 93%
- Temperature range 0 ... +60 °C

- A range of extremely effective generators suitable for use directly in the working area
- Available with straight or T-shaped housing
- Minimal space required

- Cost-effective
- No wearing parts
- Extremely fast evacuation time
- Vacuum switch (optional)

- Optional additional functions:
 - Integrated ejector pulse
 - Electrical control for vacuum ON/OFF
 - Combination of ejector pulse and actuation

VAD/VAK

Technical data ➔ Internet: vad

- Nominal width 0.5 ... 1.5 mm
- Max. vacuum 80%
- Temperature range -20 ... +80 °C

- Range of vacuum generators with sturdy aluminium housing
- VAK-...: Integrated volume, VAD-...: Connection for external volume

- Maintenance-free
- VAK: Reliable setting down of workpieces

Vacuum generators VADM/VADMI

FESTO

Key features

Compact ejectors

OVEM

Technical data → Internet: ovem

- Nominal width
0.45 ... 2 mm
- Max. vacuum
93%
- Temperature range
0 ... +50 °C

- Compact design
- Minimal installation work required
- Short switching times
- Integrated solenoid valves for vacuum ON/OFF and ejector pulse

- Filter with display
- Vacuum sensor with LCD display for continuous monitoring of the entire vacuum system
- Optional air saving function

- Reliable setting down of workpieces
- Blocking of multiple vacuum generators on a common supply manifold

VADM/VADMI

→ 9

- Nominal width
0.45 ... 3 mm
- Max. vacuum
85%
- Temperature range
0 ... +60 °C

- Compact design
- Minimal installation work required
- Short switching times
- Integrated solenoid valve (on/off)

- VADMI: additional integrated solenoid valve for ejector pulse
- Filter with display

- Optional air saving function
- Vacuum switch (optional)
- Reliable setting down of workpieces

VAD-M

Technical data → Internet: vad-m

- Nominal width
0.7 ... 2 mm
- Max. vacuum
85%
- Temperature range
0 ... +40 °C

- Compact design
- Minimal installation work required
- Short switching times
- Integrated solenoid valve (on/off)

- VAD-M-I: additional integrated solenoid valve for ejector pulse
- Reliable setting down of workpieces

Vacuum generators VADM/VADMI

Key features

FESTO

At a glance

- Compact and sturdy design
- Components with numerous individual functions form a single unit
- Extremely short switching times thanks to integrated solenoid valves
- No external or additional components required
- Easily fitted thanks to compact dimensions and therefore particularly suitable for handling tasks
- Cost effective assembly as the solenoid valve, vacuum generator and silencer are all in a single unit
- Degree of protection IP65
- With manual override
- With integrated silencer for reducing exhaust noise
- With integrated filter for the air to be evacuated and an inspection window which shows the degree of filter contamination
- With or without integrated vacuum switch to monitor the vacuum with PNP or NPN output
- With 2 vacuum ports, optional

Vacuum generators VADM

The compressed air supply of these vacuum generators is controlled by the integrated solenoid valve. When the electrical power supply is switched on, the valve is actuated and the flow of compressed air generates a vacuum at the vacuum ports by the ejector principle.

Suction stops when the supply power to the valve is switched off. The integrated silencer reduces exhaust noise to a minimum. With the vacuum generators VADM-...-P/N, the vacuum can be monitored using a vacuum switch.

- Integrated solenoid valve for:
 - Vacuum ON/OFF

Vacuum generator VADMI with ejector pulse

Compressed air enters the vacuum generator following the application of a voltage signal to the integrated solenoid valve, thereby creating a vacuum.

Once the voltage is switched off at the vacuum valve and switched on at the ejector pulse valve, the vacuum is

rapidly purged at port 2 as a result of the application of pressure. The integrated silencer reduces exhaust noise to a minimum. With the vacuum generators VADMI-...-P/-N, the vacuum can be monitored by a vacuum switch.

- Two integrated solenoid valves for:
 - Vacuum ON/OFF
 - Ejector pulse
- With sensing interface
- With integrated check valve as safety function
- Air saving function possible in combination with a vacuum switch and a higher-level logic circuit (e.g. PLC)

Vacuum generator VADMI-...-LS with ejector pulse and air saving function

This vacuum generator has an identical design as the other VADMI types. This ejector also has an integrated vacuum switch with air

saving function:
If the pressure drops below the set vacuum range, vacuum generation is switched on automatically.

- Two integrated solenoid valves for:
 - Vacuum ON/OFF
 - Ejector pulse
- With sensing interface
- With integrated check valve as safety function
- Vacuum switch for pressure monitoring
- Integrated air saving function
- Cable kit with plug sockets for solenoid coils and vacuum switches included in the scope of delivery

Vacuum generators VADM/VADMI

FESTO

Key features

Air saving function with VADM...P/N and external controller

The conventional vacuum switch → A cost-effective energy-saving measure

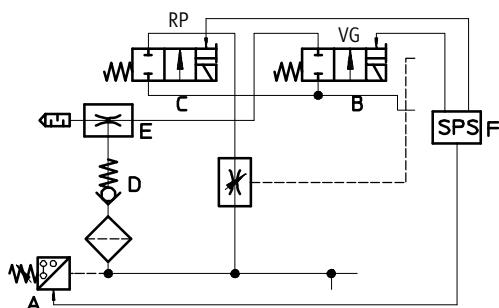

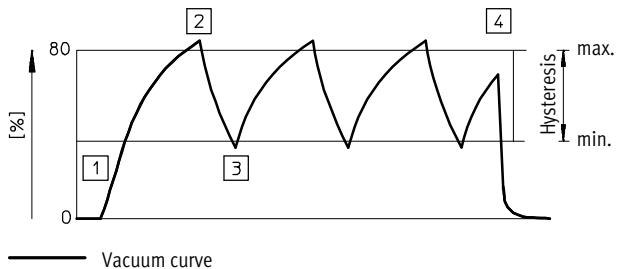

The vacuum range for holding the workpiece is set on the vacuum switch using the two potentiometers. The lower limit defines the minimum value.

Provided the vacuum level is within this range, reliable workpiece transport is guaranteed. The vacuum generator VADM is only activated by the external controller if the level drops below the minimum

value and is deactivated again once the maximum value is regained. A check valve prevents the vacuum level from being reduced during the inactive phase of vacuum generation.

The functional sequence

RP	Solenoid valve for ejector pulse	E	Vacuum generator
VG	Solenoid valve for vacuum	D	Check valve

ON/OFF

C Ejector pulse

A Vacuum switch

Vacuum on

- ① External controller F switches on the VG solenoid
 - Valve for compressed air supply B is opened
 - Vacuum generation E is activated

Vacuum stop

- ② The specified maximum level is achieved:
 - Vacuum switch A sends a signal to the external controller F
 - Controller switches the VG solenoid off
 - Vacuum generation E interrupted
 - Check valve D prevents the vacuum level from being reduced

Vacuum on

- ③ Leakage causes the vacuum level to drop to the minimum value
 - Vacuum switch A sends a signal to the external controller F
 - Controller F switches the VG solenoid back on
 - Vacuum generation E is active again
 - Constant repetition of points 2 and 3

Cycle ended: vacuum off

- ④ Transport process ended
 - External controller F deactivates VG solenoid
 - Vacuum generation E is ended
 - External controller F switches on RP solenoid
 - Ejector pulse C activated
 - Workpiece is set down

Vacuum generators VADM/VADM

Key features

FESTO

Air saving function and fault signal with VADM...-LS-P/N

The further development of the vacuum switch

In conjunction with the supplied cable kit, the vacuum generator VADM...-LS-P/N has an air saving function. The vacuum range for holding the workpiece is set on the vacuum switch using the two potentiometers.

The vacuum switch generates a pulsating signal which only actuates the solenoid for vacuum ON/OFF in the vacuum generator when the vacuum pressure has fallen below the minimum value, for example due to leakage.

At all other times, the vacuum is maintained with the help of the check valve, even when the vacuum generator is not switched on. In addition, a status signal A1 can be interrogated which is connected to +24 V during normal operation, but which is switched to 0 whenever vacuum pressure again falls below the critical value by 150 mbar due to a malfunction. This is the case, for example, if the workpiece has dropped off from the suction gripper and it is therefore

no longer possible to generate the selected vacuum range.

The three control and supply cable harnesses are combined in one branch. Just one cable containing one signal wire and three power supply wires is routed from the branch to the PLC.

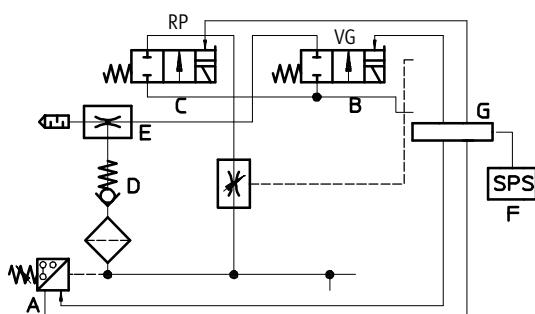

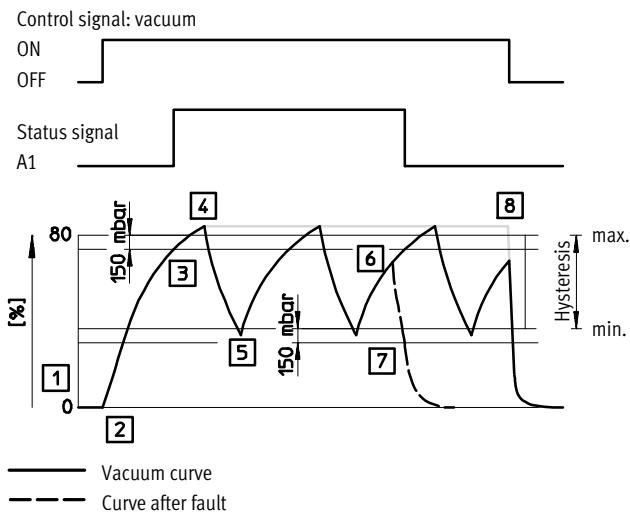

Given the decentralised control of the switching function, external actuation of the vacuum switching (air saving function) would be superfluous. As a result there is significantly less wiring.

- Note

The vacuum switch may only be operated with the included cable kit.

The functional sequence

RP Solenoid valve for ejector pulse
VG Solenoid valve for vacuum
ON/OFF

E Vacuum generator
D Check valve
C Ejector pulse
G Branch
A Vacuum switch

Start signal

- External controller F activates the vacuum switch
 - Vacuum switch A checks the vacuum status
 - No vacuum present

Vacuum on

- Vacuum switch activates the VG solenoid
 - Valve for compressed air supply B is opened
 - Vacuum generation E is activated
- Vacuum level falls more than 150 mbar below the maximum level
 - Vacuum switch sends an enable signal to the external controller F
 - Transport process can start

Vacuum stop

- The specified maximum level is achieved
 - Vacuum switch A switches the VG solenoid off
 - Compressed air supply stopped
 - Vacuum generation E interrupted
 - Check valve D prevents the vacuum level from being reduced

Vacuum on

- Leakage causes the vacuum level to drop to the minimum value
 - Vacuum switch A switches the VG solenoid back on
 - Vacuum generation E is active again

Fault: transport stop

- Major leakage causes an overly large drop in the vacuum level
 - Vacuum generator E cannot compensate for the drop in level
- Vacuum level falls to 150 mbar below the minimum value
 - Vacuum switch A sends an error message to the external controller F
 - External controller F interrupts the transport process
 - Vacuum generation E is ended

Cycle ended: vacuum off

- Transport process ended
 - External controller F deactivates VG solenoid
 - Vacuum generation E is ended
 - External controller F switches on RP solenoid
 - Ejector pulse C activated
 - Workpiece is set down

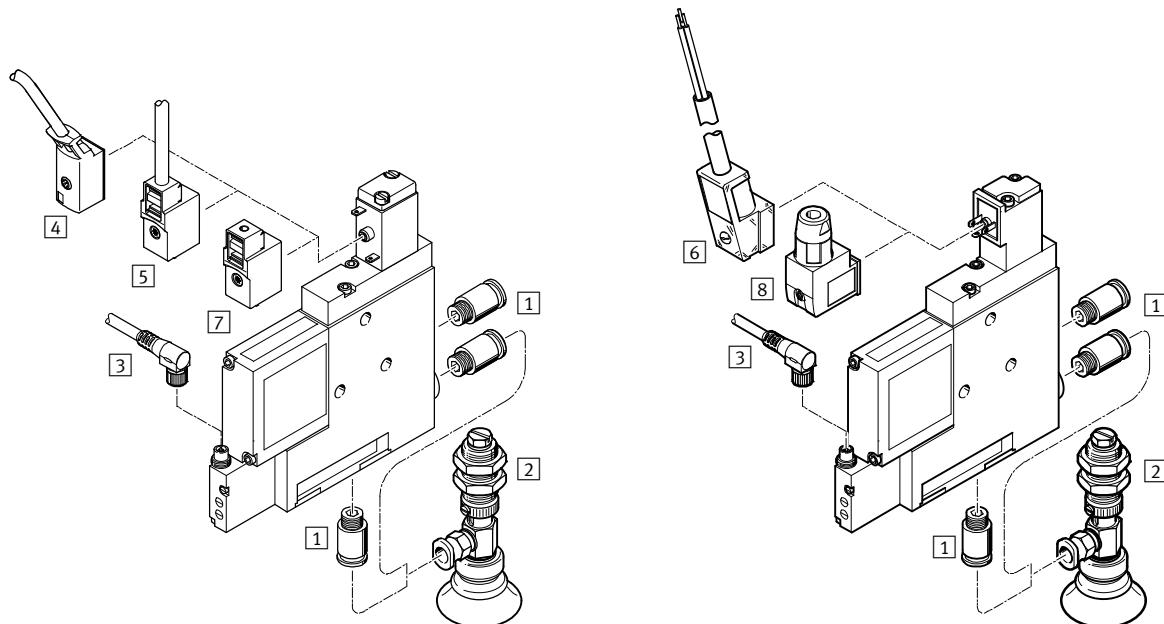

Vacuum generators VADM/VADMI

FESTO

Technical data

Dimensions

VADMI-45/70(-LS)-P/N

- [1] Supply port
- [2] Vacuum port
- [3] Manual override
- [4] Mounting thread
- [5] Mounting hole

- [7] Suitable socket for
 - VADMI-45/70:
KMYZ → LEERER MERKER
MSSD-ZBZC →
LEERER MERKER
 - VADMI-95/140/200/300:
KMEB → LEERER MERKER
MSSD-EB → LEERER MERKER

VADMI-95/140/200/300(-LS)-P/N

- [8] Connection for connecting cable NEBU-M8G4/M8W4
→ LEERER MERKER

Note

For vacuum generators VADMI-...-LS-P/N, the cable kit with plug sockets for solenoid coils and vacuum switches is included in the scope of delivery.

These vacuum generators may only be operated with the cable supplied.
