

Media separated solenoid valves VYKA

FESTO

Key features

Special characteristics

- Very easy to clean thanks to media separation
- Low media consumption thanks to small internal volume
- Materials in contact with the media conform to FDA-listed materials
- Developed according to ISO 13485
- High-quality materials, therefore also suitable for aggressive media
- High flow rate with minimal size (width 7 mm and nominal width 1.2 mm)
- High repetition accuracy, switching frequency and precision, therefore also suitable for extremely small volumes and dosing tasks
- Low power consumption as a result of holding current reduction
- Extremely flexible in use thanks to 3/2-way and 2/2-way variants as well as 12 ... 26 V DC actuation

Function

The media separated solenoid valve VYKA is designed for installation in laboratory devices. The valve is used to control gaseous and liquid media within the limits of the technical data. The chemical resistance of the valve materials coming into contact with the media must be checked for each application. The user is responsible for validating the application.

The valve VYKA is a directly actuated directional control valve with solenoid coil. In a de-energised state, the valve automatically returns to its normal position. Normally closed and normally open variants are available. The solenoid valve VYKA is additionally available in variants with or without vacuum technology.

Note

The valve uses FDA-listed materials but is not a food materials article in the sense of Regulation (EC) 1935/2004. Country-specific regulations in respect of food contact must be taken into account.

Configuration

- [1] Terminal contact for E-box VAVE or connecting cable NEBV
- [2] Solenoid valve
- [3] Screws for mounting on the sub-base (included in the scope of delivery of the valves)
- [4] Sub-base VABS
- [5] Media connections

Key features

Actuation

-  - Note

The solenoid valve VYKA is controlled by a constant current source. A holding current reduction is essential as otherwise the valve will significantly heat up. A holding current reduction can be achieved as follows:

When using E-box VAVE, holding current reduction is integrated (recommended).

When using connecting cable NEBV, a separate means of holding current reduction must be provided by the customer.

The valve control module VAEM together with the connecting cable NEBV (recommended) offers the option of actuation with holding current reduction.

Product range overview

Function	Circuit symbol	Type	Valve function	Flow rate Kv		Operating voltage		→ Page/ Internet	
				Without vacuum technology [m ³ /h] [l/min]	With vacuum technology [m ³ /h] [l/min]	In combination with VAVE-K1
