

Semi-rotary drives DRRD, twin pistons

FESTO

Festo Core Range
Solves the majority of your automation tasks

With the Festo Core Range, we have selected the most important products and functions from our broad product catalogue, and added the quickest delivery.

Worldwide: Quickest delivery – wherever, whenever
Simply good: Expected high Festo quality
Fast: Easy and fast to select

The Core Range offers you the best value for your automation tasks.

for the
star!

Characteristics

At a glance

- Rack and pinion principle
- Very high accuracy in the end positions
- Very high load bearing capacity
- Very good axial run-out at the flange shaft
- High mass moments of inertia
- Low backlash and good dynamic response
- Splash-proof design to IP65 based on EN 60529
- Defined interfaces
- Supply port at one end
- Choice of mounting options
- Ideal for use in handling applications

Wide choice of variants

Flange shaft

- Size: 8 ... 63
- Torque: 0.2 ... 112 Nm
- Swivel angle: 0 ... 180°

Drive shaft

- Size: 12 ... 40
- Torque: 0.8 ... 24.1 Nm
- Swivel angle: 0 ... 180°
- Suitable for ATEX
- Can be ordered as an accessory

Position sensing

- Size: 8 ... 12
 - C-slot for proximity switch SMT/SME-10
- Size: 16 ... 63
 - T-slot for proximity switch SMT/SME-8

External position sensing (sensor mounting)

- Size: 16 ... 63
- Position sensing possible directly at the flange shaft
- Inductive proximity switches SIES can be used in combination with external position sensing

Cushioning

- Size: 12 ... 63
- Five cushioning types available:
 - Elastic cushioning with metal end position (P)
 - Shock absorber (Y9)
 - Shock absorber, hard (Y10)
 - Shock absorber, external (Y12)
 - Shock absorber, soft (Y14)

External cushioning

- Size: 12 ... 63
- The full torque can be realised in the end positions in combination with external cushioning

Characteristics

Energy through-feed

- Size: 16 ... 63
- The energy through-feed can be used to transfer electrical signals or compressed air through the hollow shaft. This enables fast and easy supply of the parts connected to the flange (e.g. gripper)

Also suitable for IO-Link signal data transfer.

Intermediate position

- Size: 16 ... 50
- The semi-rotary drive can additionally be positioned at 90° using the intermediate-position module
- The intermediate position can be approached from both directions
- The cushioning for the intermediate position corresponds to the cushioning for the basic drive. Except in the case of cushioning Y12, when shock absorbers Y9 are used

End-position locking

- Size: 16 ... 63
- Mechanical lock in the end positions to prevent unwanted movement in unpressurised condition

Mounting options

Via through-holes

Via thread in the housing profile

Data sheet

Swivel angle

Fundamentally, the following applies:

Swivel angle $\alpha \geq$ cushioning angle β

Swivel angle $\alpha = 180^\circ + \Delta\alpha_{\text{right}} + \Delta\alpha_{\text{left}}$

Size		8	10	12
Swivel angle α	[°]	180		
Min. swivel angle $\alpha^{1)}$				
DRRD-...-P	[°]	38	37	32
DRRD-...-Y9	[°]	-	-	48
DRRD-...-Y12	[°]	-	-	20
Max. swivel angle α

DRRD-...-Y12	[°]	-	-	192
Swivel angle adjustment α per side (infinitely adjustable)				
DRRD-...-P	[°]	-100 ... +10		
DRRD-...-Y9	[°]	≥ -100 ... +10		
DRRD-...-Y12	[°]	-	-	-92 ... +6
Cushioning angle α				
DRRD-...-P	[°]	38	37	32
DRRD-...-Y9	[°]	-	-	48
DRRD-...-Y12	[°]	-	-	10

1) It is possible to set smaller swivel angles. However, this reduces the cushioning energy.

Swivel angle adjustment

Clockwise direction of rotation:

- Swivel angle decreases

Anticlockwise direction of rotation:

- Swivel angle increases

The swivel angle is adjusted via the cushioning elements using an Allen key. Any reduction in the swivel angle should preferably be evenly split between the two end positions.

Data sheet

Max. load capacity at the flange shaft

The zero point for dimension z is always the flange level of the basic drive, independently of the attachments (flange module).

The following equation applies to combined loads (axial and radial):

$$\frac{F_y(z)}{F_{y \max.}(z)} + \frac{F_x(y)}{F_{x \max.}(y)} \leq 1$$

Dynamic values

Max. radial force F_y as a function of distance z

Max. axial force F_x as a function of distance y

Static values

Max. radial force F_y as a function of distance z

Max. axial force F_x as a function of distance y

Data sheet

Max. load capacity on the drive shaft (DARF-Q11)Max. radial forces F_y / axial forces F_x / bending moment M

- For the radial forces F_y , the limits of the flange shaft → page 14 and max. bending moment of the drive shaft apply → table below.
- The bending moment represents the load limit of the drive shaft and must not be exceeded.
- The zero point for dimension z is always the flange level of the basic drive, independently of the attachments (flange module).
- The axial force represents an additional load.

Note

If, in the end positions, a torque which exceeds 50% of the theoretical torque acts against the direction of rotation, no exact end position is guaranteed.

This can be avoided by using external shock absorbers (Y12) or a semi-rotary drive with double the torque.

Note

The cushioning for the intermediate position corresponds to the cushioning for the basic drive. Except in the case of cushioning Y12, when shock absorbers Y9 are used.

In combination with cushioning P, the intermediate position is only available for sizes 16 ... 32.

Swivel angle

Fundamentally, the following applies:
 Swivel angle $\alpha \geq$ cushioning angle β
 Swivel angle $\alpha = 180^\circ + \Delta\alpha_{\text{right}} + \Delta\alpha_{\text{left}}$

Note
 Illustrated position of the flange shaft corresponds to the mid-position (swivel angle 90°)

1) It is possible to set smaller swivel angles. However, this reduces the cushioning energy
 2) The max. swivel angle is reduced by approx. 10° in combination with the external sensor mounting

Swivel angle adjustment

- Clockwise direction of rotation:
- Swivel angle decreases
- Anticlockwise direction of rotation:
- Swivel angle increases

The swivel angle is adjusted via the cushioning elements using an Allen key. Any reduction in the swivel angle should preferably be evenly split between the two end positions.

Swivel angle adjustment of the intermediate position → page 40

Energy through-feed DRRD-...-P...E...

Function

The energy through-feed can be used to transfer electrical signals or compressed air through the hollow shaft.

Advantages

- Fast and easy supply of the parts connected to the flange (e.g. gripper)
- Tubing and electrical cables are not damaged by the rotation
- Two variants available:
 - Pneumatic
 - Pneumatic and electrical
- Different number of connections depending on the size

Note
Only connecting cables with straight connectors can be used (→ page 64).

Intermediate position DRRD-...-PS1

Function

The intermediate-position module enables an additional position to be set, at half of the nominal rotation angle (90°).

A piston with two screwed-in guide systems is supplied with compressed air and moves the gear racks of the unpressurised semi-rotary drive until both pistons rest on the plungers positioned in the guide systems and are held in this position. The movement is cushioned using a shock absorber.

To move to the other end position, the semi-rotary drive is pressurised with compressed air. The piston of the basic drive thus moves the entire intermediate-position piston back into its initial position.

Characteristics

- Setting range: $90^\circ \pm 10^\circ$
- Cushioning variants: P, Y9
- Can be approached and travelled through from both end positions
- Position sensing of the intermediate position possible

Setting the swivel speed

Semi-rotary drive and intermediate-position module must only be operated with controlled air flow. The flow control should be connected as close as possible to the semi-rotary drive (e.g. one-way flow control valve GRLA-...) → page 65.

In the event of pressure failure, the payload may hit an end position in an uncontrolled manner. In order to prevent this, piloted check valves HGL or an air reservoir VZS are recommended → page 65.

The following movements are adjusted using the supply ports [1] and [2]: end position → intermediate position

Both directions can be adjusted separately from each other.

The following movement is adjusted via supply port [3]:

Intermediate position → end position

Both directions are set simultaneously.

Data sheet

DRRD-...-PS1 – Intermediate position

Swivel angle adjustment

By pushing the shock absorber as far as the stop, the flange shaft of the semi-rotary drive rotates into the intermediate position.

In delivered state, the intermediate position is set to 90°. By screwing in or

unscrewing the shock absorbers, the swivel angle can be adjusted by ±10°. If the setting dimension X_{max} is exceeded, the shock absorber can no longer completely cushion the movement.

If the setting dimension X_{min} is not reached, the shock absorber not only cushions the intermediate position, but also the end position of the semi-rotary drive.

Wiring of the proximity switches in combination with the energy through-feed

Size 16/20

Size 25/32/35

Size 40/50/63

Note

Proximity switches with plugs must be used for attachments (e.g. grippers) at the output. For sizes 16 ... 35 these can be connected directly to the energy through-feed module.

For sizes 40 ... 63, the proximity switch must be connected to the energy through-feed module through a Y-distributor.

Setting the swivel speed

Basic drive and intermediate position module must only be operated with controlled air flow. The flow control should be connected as close as possible to the semi-rotary drive (e.g. one-way flow control valve GRLA-...) → table below

In the event of pressure failure, the payload may hit an end position in an uncontrolled manner. In order to prevent this, piloted check valves HGL or an air reservoir VZS are recommended.
