

Terminal CPX-P

FESTO

Key features

Key features

Installation concept

- Economical from the smallest configuration up to the maximum number of modules
- Up to 9 electrical input/output modules plus bus node and pneumatic interface/electronics modules for valves
- Extensive range of functions and connection options for the electrical modules
- Choice of connection technology for technically and economically optimised connections
- Can be used as a dedicated remote I/O module

Electric

- High operating voltage tolerance ($\pm 25\%$)
- Open to all fieldbus protocols and Ethernet
- IT services and TCP/IP such as remote maintenance, remote diagnostics, web server, SMS and email alert
- Digital inputs and outputs, 4-way/8-way/16-way, optionally available with individual channel diagnostics
- Analogue inputs and outputs, 2-way/4-way
- Analogue inputs and outputs with HART protocol
- Input modules for connecting NAMUR sensors
- Pressure inputs
- Temperature inputs
- IP65 or IP20

Mounting

- Wall or DIN rail mounting, also on mobile units
- Conversions/extensions are possible at any time, individual links
- Modular system offering a range of configuration options
- Fully assembled and tested unit
- Reduced costs for selection, ordering, assembly and commissioning thanks to the central CPX-P terminal
- Choice of pneumatic components for optimised control chain

Operation

- Fast troubleshooting thanks to an extensive selection of LEDs (some of which are multi-coloured) on the bus node and on all I/O modules
- Suitable for direct machine mounting (IP65/IP67) or in a control cabinet with a terminal connection (IP20)
- Supports module and channel-oriented diagnostics
- Fieldbus/Ethernet remote diagnostics
- Innovative diagnostic support with integrated web server/web monitor or Festo Maintenance Tool (CPX-FMT) with USB adapter (NEFC) for PC
- Optimised commissioning thanks to parameterisable functions
- Reliable servicing with connection blocks and modules that are quick to replace without changing the wiring

Key features

Variants of the CPX-P terminal controller (with bus node, without preprocessing)

Bus node

Different bus nodes are used for integration in the control systems of various manufacturers.

The CPX-P terminal can therefore be operated on commonly used fieldbus systems:

- PROFIBUS-DP
- PROFINET

- DeviceNet®
- CANopen

Integration in universal networks based on Ethernet opens up new possibilities. Faster data transmission, real-time capability and above all additional IT services such as file transfer,

web server, as website integrated in the CPX-P terminal, text message/email alerts, etc. open up a wide range of synergies.

These include standardised and universal communication technology across all areas, including operating level, management level and field level

in the production environment, with protection to IP65.

The following protocols are supported:

- EtherNet/IP
- Modbus/TCP
- PROFINET
- EtherCAT®

Bus node

- [1] Higher-order controller (PLC)
[2] Fieldbus

- Communication with the higher-order controller via fieldbus
- No preprocessing
- Fieldbus protocol dependent on CPX bus node used
- More than 90 I/Os, depending on bus node used

Industrial Ethernet bus node

- [1] Higher-order controller (PLC)
[2] Industrial Ethernet
[3] IT services:

- Web
- Email
- Data transmission

- Connection to a higher-order controller directly via EtherNet/IP, Modbus/TCP, EtherCAT® or PROFINET
- No preprocessing
- Monitoring via Ethernet and web applications
- More than 300 I/Os

 **Note**

Every electrical interface can be combined with an appropriate number of I/O modules and/or pneumatic components, depending on its address capacity.

Likewise, every pneumatic variant of the CPX-P terminal can be operated with every electrical interface variant.

Key features

Variants of the CPX-P terminal controller (with preprocessing in the control block)

Control block

The optional front end controllers CPX-CEC enable simultaneous access via Ethernet, in parallel with a bus

node, as well as autonomous preprocessing. Access via Modbus/TCP and EasyIP is also possible.

Commissioning, programming, and diagnostics using the Festo software tool FST with hardware configurator.

With control block in stand-alone mode

[1] CODESYS/FST

- Decentralised controller with direct machine mounting
- Downloading programs via Ethernet (or via the programming interface)
- Supports full expansion of all CPX peripherals
- More than 300 I/Os

Can be successfully used in the follow applications:

- Stand-alone individual workstations
- Interlinked, stand-alone sub-systems
- Automation using IT technology

With control block in Festo EasyIP mode

[1] Industrial Ethernet

- [2] IT services:
- Web
 - Email
 - Data transmission

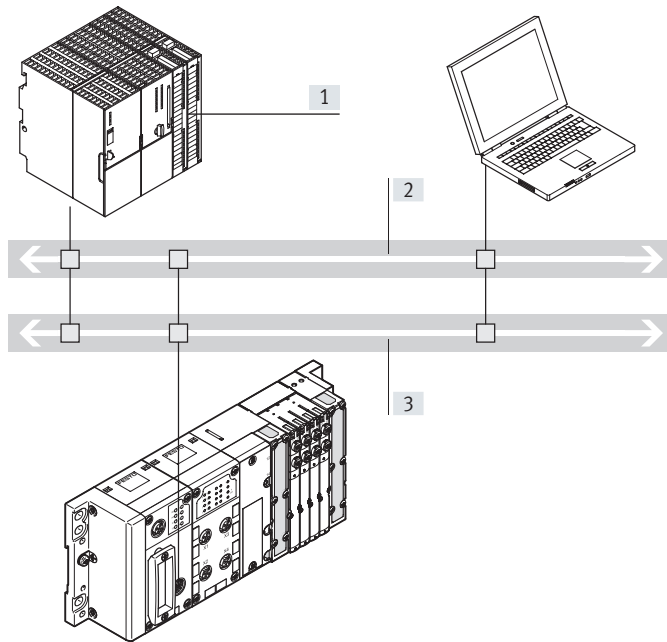

- Fast preprocessing of the CPX-P peripherals in the control block
- Exchange of any data between the control blocks via EasyIP
- Remote diagnostics
- No higher-order controller is required
- More than 300 I/Os per CPX-P control block

Key features

Variants of the CPX-P terminal controller (with preprocessing in the control block)

With control block as remote controller on Ethernet

Remote controller via Ethernet as the preprocessing unit for decentralised, stand-alone sub-systems using IT technology.

- [1] Higher-order controller (PLC)
 [2] Industrial Ethernet
 [3] IT services:
 – Web
 – Email
 – Data transmission

- Connection to a higher-order controller via Ethernet, no further bus node is required
- Monitoring via Ethernet and web applications
- Preprocessing of the CPX-P peripherals by CPX-P control block
- More than 300 I/Os

With control block as remote controller on the fieldbus

Fieldbus remote controller (combination with bus nodes for PROFIBUS DP, PROFINET, CANopen, DeviceNet® or EtherCAT®) as the preprocessing unit

for decentralised, stand-alone sub-systems.

- [1] Higher-order controller (PLC)
 [2] Fieldbus
 [3] Industrial Ethernet
 [4] IT services:
 – Web
 – Email
 – Data transmission

- Fast preprocessing of the CPX-P peripherals in the control block
- Communication with the higher-order controller via fieldbus
- Optional additional monitoring via Ethernet and web applications
- Downloading programs via programming interface
- More than 300 I/Os, bus node is only used for communication with the higher-order PLC
- Option of two bus nodes for redundant communication configuration

Key features

Variants of the CPX-P terminal controller (with preprocessing in the control block)

With control block as CANopen fieldbus master

- [1] Higher-order controller (PLC)
- [2] Industrial Ethernet
- [3] IT services:
 - Web
 - Email
 - Data transmission
- [4] Fieldbus (CANopen)

Characteristics:

- Connection to a higher-order controller via Ethernet, no further bus node is required
- Monitoring via Ethernet
- Preprocessing of the CPX-P peripherals by CPX-P control block
- More than 300 I/Os
- Up to 128 stations with repeater technology on CANopen

Operating modes:

- Remote controller on Ethernet
- Control block in Festo EasyIP mode

Key features

Interface of inputs and outputs to the CPX-P terminal

Digital and analogue CPX-P I/O modules

Electrical connection

The connection technology for sensors and additional actuators offers a wide range of digital and analogue input and output modules and is freely selectable, as appropriate to your standard or application.

The input/output modules can be combined as required with the connection blocks:

- M12, 5-pin
- M12 5-pin, with quick lock and metal thread
- M12, 8-pin
- M8, 3 pin
- M8, 4 pin
- Sub-D 25-pin
- CageClamp® (with cover also to IP65/67)
- Screw terminal and spring-loaded terminal

CPX modules for NAMUR sensors

Electrical connection

The electronics modules for NAMUR sensors can only be combined with certain connection blocks.

The input modules can be combined as required with the connection blocks:

- M12, 4-pin
- Screw terminal and spring-loaded terminal

CPX modules for NAMUR sensors, intrinsically safe circuits for ATEX applications

- [1] Higher-order controller (PLC)
- [2] Non-ATEX zone; non-intrinsically safe circuits are permitted
- [3] ATEX zone; only intrinsically safe circuits are permitted
- [4] CPX input module for NAMUR sensors, non-intrinsically safe design
- [5] CPX input module for NAMUR sensors, intrinsically safe design
- [6] Actuator/machine component with NAMUR sensors
- [7] Fieldbus

CPX-P modules are suitable for configuring intrinsically safe or non-intrinsically safe circuits, depending on the design selected. This enables components from both safe and potentially explosive zones to be connected to the CPX-P terminal. The components for the intrinsically safe zone are marked in blue or completely coloured blue to distinguish them visually.

- Note

Intrinsically safe circuits are circuits which release so little energy during operation, or in the event of certain errors under specified test conditions, that no ignition can occur in a particular potentially explosive atmosphere.

Key features

Interface of inputs and outputs to the CPX-P terminal

With CPX-CTEL interface

- Up to 4 devices with individual electronic protection per CPX-CTEL master
- Max. 64 inputs/64 outputs per I-Port interface
- The maximum length of a string is 20 m.
- Input modules with 16 digital inputs (connection technology M8 3-pin and M12 5-pin)
- Valve terminals with I-Port interface (up to 48 solenoid coils, different valve functions)

Several CPX-P CTEL masters can be combined on one CPX-P terminal (depending on the controller used). Combination of central CPX-P I/O modules and decentrally mounted I/O modules with I-Port interface.

With CPX-CTEL-2 interface

- Up to 2 IO-Link® devices with individual electronic protection per CPX-CTEL-2 interface
- Max. 16-byte inputs/16-byte outputs per IO-Link® device
- The maximum length of a string is 20 m.

Several CPX-CTEL-2 interfaces can be combined on one CPX-P terminal (depending on the controller used). Combination of central CPX-P I/O modules and decentrally mounted I/O modules with IO-Link interface.

Key features

Pneumatic variants of the terminal CPX-P

With valve terminal MPA-S – centralised

The electrical terminal CPX-P is a modular peripheral system for valve terminals. The system is specifically designed so that the valve terminal can be adapted to suit different applications.

With the modular design, the number of valves, inputs and additional outputs can be configured to suit the application.

Ordering

The CPX-P terminal with valve terminal is fully assembled according to your order specifications and individually tested. It consists of the electrical peripherals including the desired actuation and the selected components from the MPA-S modular system.

The CPX-P terminal with valve terminal is ordered using two separate order codes. One order code defines the electrical peripherals type CPX-P, while the other specifies the pneumatic components of the valve terminal.

The electrical peripherals type CPX-P can also be configured without a valve terminal and can be used on a field-bus. To order this, only the order code for the electrical peripherals is required.

The order lists for the pneumatic components can be found at
 → Internet: mpa-s
 (valve terminal MPA-S)

- Programming with CODESYS
 - Ethernet interface
 - Modbus/TCP
 - EasyIP
 - CANopen master

CTEL interface

→ Page 86

- Interface CPX-CTEL
- CTEL master
 - Max. 4 devices with individual electronic protection
 - Max. 64 inputs/64 outputs per I-Port interface
 - The maximum length of a string is 20 m

Electrical interface CPX-CTEL-2

→ Page 92

- Interface CPX-CTEL-2
- Master for IO-Link®
 - Max. 2 devices with individual electronic protection
 - Process data length of the inputs and outputs is limited to 16 bytes for inputs and 16 bytes for outputs per port
 - The maximum length of a string is 20 m

Modules for actuating pneumatic drive units

→ Page 97

- CPX-CMIX
- Measuring module
 - CAN input (Festo specification) for measuring signal

- Recording the absolute position values or speed values of the connected drive

Polymer connection block

- Direct machine mounting (connection block to IP65/IP67)
- M8, 3-pin
 - M8, 4 pin
 - M12, 5-pin
 - M12 5-pin quick lock, shielded with metal thread
 - M12, 8-pin
 - Sub-D 25-pin
 - Spring-loaded terminal with cover

- Protected fitting space (degree of protection IP20)
- Spring-loaded terminal

- Shielding concept
- Optional screening plate for connection block with M12 connection technology

Metal connection block

- Direct machine mounting (connection block to IP65/IP67)
- M12, 5-pin

Peripherals overview

Individual overview of modules

Digital electronics module for inputs/outputs

→ Page 104

Digital inputs

- 4 digital inputs
- 8 digital inputs
- 16 digital inputs

Digital outputs

- 4 digital outputs (1 A per channel, individual channel diagnostics)
- 8 digital outputs (0.5 A per channel, individual channel diagnostics)
- 8 digital outputs (2.1 A/50 W lamp load per channel pair, individual channel diagnostics)

Multi I/O modules

- 8 digital inputs and 8 digital outputs
- 2 digital inputs (counter channels, connection to various encoders) and 2 digital outputs (directly controlled by the input values)

Analogue electronics module for inputs/outputs

→ Page 139

Analogue inputs

- 2 analogue inputs (0 ... 10 V DC, 0 ... 20 mA, 4 ... 20 mA)
- 4 analogue inputs (1 ... 5 V, 0 ... 10 V, -5 ... +5 V, -10 ... +10 V, 0 ... 20 mA, 4 ... 20 mA, -20 ... +20 mA)
- 4 analogue inputs with HART protocol

Analogue temperature inputs

- 4 analogue inputs for temperature measurement (Pt100, Pt200, Pt500, Pt1000, Ni100, Ni120, Ni500, Ni1000)
- 4 analogue inputs for temperature measurement (thermocouple and PT1000 sensor for cold junction compensation)

Analogue outputs

- 2 analogue outputs (0 ... 10 V DC, 0 ... 20 mA, 4 ... 20 mA)
- 4 analogue outputs with HART protocol

PROFIsafe input module

→ Page 115

Digital inputs

- 8 digital inputs
- 11 function modes
- 5 independent clock outputs

PROFIsafe shut-off module

→ Page 158

Digital outputs

- 2 digital outputs
- Supply voltage for valves can be shut off

Peripherals overview

Individual overview of modules

Connection block for NAMUR sensors and HART input/output module

- Direct machine mounting (connection block to IP65)
 - M12, 4-pin
- Protected fitting space (connection block to IP20)
 - Screw terminal
 - Spring-loaded terminal

Digital electronics module for NAMUR sensors

→ Page 100

- Digital inputs
- 8 digital inputs for NAMUR sensors or wired mechanical contacts
 - Intrinsically safe design with additional protective measures in the event of failure

Metal interlinking block – Individual links

→ Page 163

- System linking
 - Different voltages for supplying the modules
 - Serial communication between the modules
- System supply
 - 7/8" 5-pin

- In addition to system linking, power supply for the
- Electronics plus sensors (8 A)
 - Valves plus actuators (8 A)

- Additional supply
In addition to system linking, power supply for the
- Actuators (8 A per supply)

- Extendibility
- Can be expanded as required by up to 10 interlinking blocks

Note
The 7/8" supply is subject to the following restrictions due to the available accessories:

- 5-pin 8 A

Pneumatic interface MPA-S

→ Page 169

- Valve terminal
- MPA1 (360 l/min)
 - MPA14 (550 l/min)
 - MPA2 (700 l/min)
 - Up to 128 solenoid coils
 - Up to 16 modules can be configured

End plate

- End plate
- Left
 - Right (for use without valves)

Peripherals overview

General basic data and guidelines

Max. 11 modules in total:

- One bus node and/or one control block
- Up to 9 additional input/output modules
- In addition a pneumatic interface
 - Always positioned as the last module on the right-hand side
 - 16 MPA modules can be configured

- Address capacity max. 512 inputs and 512 outputs, depending on bus node or control block
- One interlinking block with system supply
- Multiple interlinking blocks with additional supplies
 - Always positioned to the right of the interlinking block with system supply

- The connection blocks can be combined with the electronics modules for inputs/outputs, with restrictions (→ table below)
- The electronics modules for inputs/outputs can be combined with various interlinking blocks

Key features – Electrical components

Electrical connection – Connection block with M8, 3-pin connection

CPX-AB-8-M8-3POL

- Compact for pre-assembled individual connection
- 8 sockets
- 3-pin design for connecting one channel per socket

Note

Festo delivers pre-assembled connecting cables M8/M12 (modular system NEBA) on request:

- Tailored to the application
- Perfect fit
- Easy to install

Combination of connection block and electrical connection technology

Key features – Mounting

Hood

Description

→ 175

The CPX hood CAFC is a space- and cost-saving alternative to a control cabinet. It is designed as an extruded aluminum profile and is installed on a mounting plate. The valve terminal is well protected and is quick to install without the need for a complex cabinet through-feed for cables and tubing.

The rail and the two mounting brackets are mounted on a base plate. The hood is attached to the retaining rail and secured with two screws. There is also a stand-by position (detent of the hood in the open position).

The hood is locked using two side screws (which meet the requirements for a special fastener in compliance with ATEX).

The CPX hood can be ordered online using the valve terminal configurator.

Advantages of the CPX hood

- Impact protection (min. 7 J) for the modules underneath in combination with a suitable mounting plate provided by the user
- Protection against electrostatic discharge by using electrically conductive materials and the option of connecting an earth wire
- Protection against disconnection of live plugs (by securing the hood with at least one special fastener to EN 60079-0, 9.2 and 20)
- UV protection for the CPX-P and MPA modules underneath

Points to note when using the CPX hood

- CPX-P power supply via angled plugs, no T-plugs
- Electrical supply plate/additional supply only possible with angled plug
- No MPA vertical stacking
- Larger push-in fittings (for tubing O.D. larger than 12 mm) can only be used with the angled design
- Ducted exhaust air only with elbow connector
- The permissible ambient temperature range of the valve terminal is reduced by 5 °C.

Note

The CPX hood has no influence on the ATEX classification of the valve terminal or of the CPX-P terminal.

The CPX hood has no influence on the IP protection class of the valve terminal or of the CPX-P terminal.

The CPX hood does not protect against the effects of the weather in installations that are not in enclosed spaces.

Key features – Mounting

Hood

Mounting

Procedure:

- Assemble the rail and mounting bracket included in the mounting kit
- Attach the earthing cable
- Assemble the hood (if applicable, screw together several hood sections and attach the side covers)
- Attach and secure the hood

- [1] Side cover
- [2] Earthing cable
- [3] Hood section
- [4] Slot nut with screws, for joining the hood sections
- [5] Rail
- [6] Mounting bracket

Technical data

Weight:

- Hood: approx. 500 g per 100 mm of length
- Mounting rail: approx. 550 g per 1000 mm of length
- Side pieces: approx. 500 g per side
- Ambient temperature $-5 \dots +50 \text{ }^{\circ}\text{C}$
- RoHS-compliant

Plug coding

The connection blocks CPX-P-AB-2XKL-8POL and CPX-P-AB-2XKL-8POL-8DE-N-IS, and the sockets NECU-L3G8, can be matched to one another using the coding elements CPX-P-KDS-AB-2XKL.

This reduces the possibility of the socket being plugged back into an incorrect slot after being disconnected from the CPX-P terminal (connection safeguard).

Key features – Mounting

Mounting options

The valve terminals with CPX-P terminal support different mounting options for direct machine mounting with a

high degree of protection and control cabinet installation.

DIN rail mounting

The DIN rail mounting is part of the rear profile of the CPX-P interlinking blocks. The CPX-P terminal can be attached to the DIN rail using the DIN rail mounting kit.

The CPX-P terminal is mounted on the DIN rail (see arrow A) and

then swivelled onto the DIN rail and secured in place with the clamping element (see arrow B).

The optional earthing plate enables a connection to be established to the machine potential/earth in one easy step.

The following mounting kit is needed for DIN rail mounting:

- CPX-CPA-BG-NRH

This enables the CPX-P terminal to be mounted on DIN rails in accordance with EN 60715.

An additional mounting kit may be required for combination with valve terminals.

Wall mounting

The end plates of the CPX-P terminal, the valve terminal and the pneumatic interface include mounting holes for wall mounting. Additional mountings for the CPX-P terminal are available for longer valve terminals.

Additional mountings

Additional mounting brackets for the CPX-P terminal that can be screwed onto the interlinking blocks are available for longer valve terminals.

Note

For CPX-P terminals with 4 or more interlinking blocks, additional mounting brackets of the type CPX-M-BG-RW must be used every 100 or 150 mm. These are supplied pre-assembled.

Linking with screws

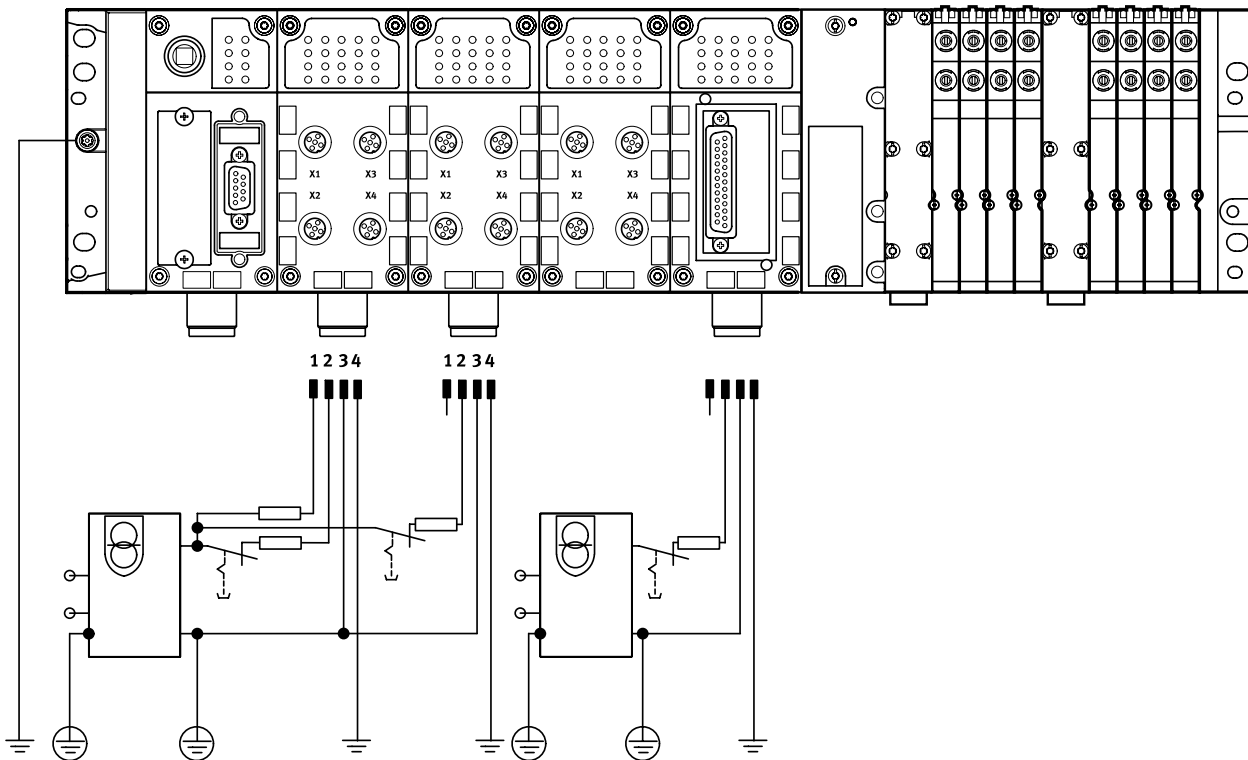

The CPX-P modules are mechanically connected using an angled fitting. The CPX-P terminal can thus be expanded at any time.

Key features – Power supply

Power supply concept

General

The use of decentralised devices on the fieldbus – particularly with a high degree of protection for direct machine mounting – demands a flexible power

supply concept. A valve terminal with CPX-P is, in principle, supplied with all voltages via a single connection.

A distinction is made between supply for

- Electronics plus sensors
- Valves plus actuators

Connection technology:

- 7/8"

Interlinking blocks

Interlinking blocks represent the backbone of the CPX-P terminal with all supply lines. They provide the power

supply for the modules used on them as well as their bus connections. Many applications require the CPX-P terminal to be segmented into voltage

zones. This applies in particular to the separate disconnection of the outputs. The interlinking blocks provide either an easy-to-install central power supply

for the entire CPX-P terminal or galvanically isolated, all-pin disconnectable potential groups/voltage segments.

Key features – Power supply

Interlinking blocks

With system supply

- CPX-M-GE-EV-S-7/8-5POL
- CPX-M-GE-EV-S-7/8-5POL-VL

Connection technology

- 7/8" 5-pin

- For CPX-P terminal modules and connected sensors
- For valves that are connected to the CPX-P terminal via a pneumatic interface

- For actuators that are connected to output modules of the CPX-P terminal

Without power supply

- CPX-M-GE-EV
- CPX-M-GE-EV-FVO

With additional supply for outputs

- CPX-M-GE-EV-Z-7/8-5POL

Connection technology

- 7/8" 5-pin

- For actuators that are connected to output modules of the CPX-P terminal

-  - Note

For 7/8":

- Commercially available accessories are often limited to max. 8 A

-  - Note

The valve terminal MPA-S has either a 7/8" 5-pin, 7/8" 4-pin or M18 3-pin power supply for one or more valve voltage zones. Galvanically isolated,

all-pin disconnectable with voltage monitoring in the following MPA module.

Key features – Diagnostics

Diagnostics

System performance

- [1] Undervoltage monitoring
- [2] Diagnostics via bus interface
- [3] Diagnostic overview LED
 - Fieldbus status
 - CPX-P status
- [4] Status and diagnostic LED for module and I/O channels
- [5] Module and channel-specific diagnostics
- [6] Valve-specific diagnostic module and solenoid coils

Detailed diagnostic functions are needed in order to quickly locate the causes of errors in the electrical installation and therefore reduce downtimes in production plants.

A basic distinction is made between on-the-spot diagnostics using LEDs or PC and diagnostics using a bus interface.

The CPX-P terminal supports on-the-spot diagnostics via a row of LEDs. This is separate from the connection area and therefore provides good visual access to status and diagnostic information.

Module and channel-specific diagnostics are supported, for example:

- Undervoltage detection for outputs and valves
- Short circuit detection for sensors, outputs and valves
- Open-load detection for a missing solenoid coil
- Storage of the last 40 causes of errors with error start and error end

The diagnostic messages can be read out via the bus interface in the higher-order controller and visualised for the central recording and evaluation of error causes. This is done using the individual fieldbus-specific channels. The CPX-CEC also offers the option of access via the integrated Ethernet interface (remote maintenance via PC/web applications).

Overview of LEDs on the bus node

- [1] Fieldbus-specific LEDs
On each bus node, a maximum of 4 fieldbus-specific LEDs display the fieldbus communication status of the CPX-P terminal with the higher-order controller.

- [2] CPX-P-specific LEDs
A further 4 CPX-P-specific LEDs provide non-fieldbus-specific information about the status of the CPX-P terminal, for example
 - Power system
 - Power load
 - System error
 - Modify parameters

Input/output module status and diagnostic LEDs

- [1] Status LEDs for the inputs and outputs
Each input and output channel is assigned a status LED.

- [2] Channel-oriented diagnostic LEDs
Depending on the module design, another diagnostic LED is available for each I/O channel

- [3] Group diagnostic LEDs
An LED displays the group diagnostics for each module

Key features – Parameterisation

Diagnostics

Display on a PC

- | | |
|---|-------------------------------------|
| [1] CPX-P terminal with valve terminal | Maintenance Tool (CPX-FMT) software |
| [2] Adapter diagnostic interface to USB | – Error location and type |
| [3] Laptop/portable device with USB interface and installed CPX-P | – Without programming |
| | – Storing the configuration |
| | – Preparing screenshots |

Parameterisation

Changes to the application are often required during commissioning. The parameterisable characteristics of the CPX-P modules mean that functions can be very easily changed by using configuration software. This reduces

the number of modules needed and, consequently, the amount of storage space required. It is therefore possible, for example, to reduce the input debounce time for an input module – normally 3 ms – to

0.1 ms on a "fast" input module for faster processes, or to set the response of a valve following a fieldbus interruption. Depending on the modules used, parameterisation can be performed

via the following interfaces:

- Ethernet
- Fieldbus
- Control block direct interface (programming interface)

- [1] Input debounce time 3 ms
[2] Input debounce time 0.1 ms

Key features – Addressing

Addressing

The various CPX-P modules occupy a different number of I/O addresses within the CPX-P system. The maximum address space for bus nodes depends on the performance of the fieldbus systems.

Maximum system configuration:

- 1 bus node or control block
- 9 I/O modules
- 1 pneumatic interface (e.g. pneumatic interface MPA-S with up to 16 MPA sub-bases)

The maximum system configuration can be limited in individual cases by exceeding the address space.

**Note**

Please refer to the detailed description of the configuration/addressing rules in the technical data for CPX-P bus nodes.

 **Note**

The bandwidth of the bus nodes can be restricted by the choice of module and the maximum number of modules.

Datasheet

 Module width
50 mm

 Repair service

 **Note**

The data shown here apply to the CPX-P system. If components with lower values are used in the system, the specification for the entire system is reduced to the values of those components.

Example

Degree of protection IP65 applies only to the fully assembled system with fitted plugs or covers (which must also conform to IP65). If components with a lower degree of protection are used, the protection level of the entire system is reduced to the degree of protection of the component with the lowest degree of protection, for example CageClamp connection block with degree of protection IP20.

tem is reduced to the degree of protection of the component with the lowest degree of protection, for example CageClamp connection block with degree of protection IP20.

1) More information www.festo.com/catalogue/... → Support/Downloads.

2) For information about the area of use, see the EC declaration of conformity at: www.festo.com/catalogue/... → Support/Downloads.

If the devices are subject to usage restrictions in residential, commercial or light-industrial environments, further measures for the reduction of the emitted interference may be necessary.

 **Note**

The values indicated represent the maximum performance limits that can be achieved with the fully assembled product.

Depending on the individual components used, the actual value achieved for the overall product may be lower.

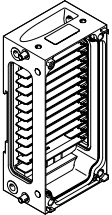

You can select e.g. the individual components required to achieve the ATEX category by choosing the corresponding features in the online product configurator:

User documentation

Comprehensive user documentation is vital for the fast and reliable use of fieldbus components. The manuals provided by Festo contain step-by-step instructions for using the CPX-P terminal:

1. Installation
2. Commissioning and parameterisation
3. Diagnostics

Application-oriented explanations are provided for integrating the CPX-P terminal in the programming and configuration software of the various controller manufacturers.

Use the order code to select the language you want.

The manual for the configuration you have ordered is supplied automatically.

Device description files and icons are provided to support the integration of the CPX-P terminal in the configuration software of the various controller manufacturers.

The documents can be downloaded quickly and easily from the Festo website.

→ www.festo.com

Overview – User documentation

Type	Titel	Description
Pneumatics		
P.BE-MPA-...	Valve terminal with MPA-S pneumatics	Instructions on assembly, installation, commissioning and diagnostics of the MPA-S pneumatic components.
Electronics		
P.BE-CPX-SYS-...	System description, installation and commissioning	Overview of the design, components and mode of operation of the CPX-P terminal; installation and commissioning instructions as well as basic principles of parameterisation.
CPX-FVDA-P2-...	PROFIsafe shut-off module	Connection technology and assembly, installing and commissioning instructions for the PROFIsafe shut-off module of the type CPX-FVDA-P2.
P.BE-CPX-EA-...	CPX-P I/O modules, digital	Connection technology and assembly, installation and commissioning instructions for digital input and output modules of type CPX-... as well as the MPA pneumatic interface.
P.BE-CPX-P-EA-...	CPX-P I/O modules, NAMUR sensors	Connection technology and assembly, installation and commissioning instructions for digital input and output modules of type CPX-P-....
CPX-F8DE-P-...	Input module CPX-F8DE-N	Connection technology and assembly, installation and commissioning instructions for the PROFIsafe input module of type CPX-F8DE-P.
P.BE-CPX-2ZE2DA-...	I/O module CPX-2ZE2DA	Connection technology and assembly, installation and commissioning instructions for counter modules of type CPX-2ZE2DA.
P.BE-CPX-AX-...	CPX-P I/O modules, analogue	Connection technology and assembly, installation and commissioning instructions for analogue input and output modules of type CPX-... as well as pressure sensors and proportional pressure regulators.
P.BE-CPX-CTEL-...	CPX CTEL interface	Instructions on assembly, installation, commissioning and diagnostics of the CTEL master.
P.BE-CPX-CTEL-LK-...	Electrical interface CPX-CTEL-2	Instructions on assembly, installation, commissioning and diagnostics of the electrical interface for IO-Link®.
P.BE-CPX-CMIX-...	CPX measuring module	Instructions on assembly, installation, commissioning and diagnostics of the measuring module (CMIX).
P.BE-CPX-FB-... CPX-FB-...	CPX bus node	Instructions on assembly, installation, commissioning and diagnostics of the relevant bus node.
CPX-(M)-FB33_35/43_45-...	CPX bus node for PROFINET	Instructions on assembly, installation, commissioning and diagnostics of the relevant bus node.
P.BE-CPX-CEC-...	CPX-CODESYS controller (control block)	Instructions on assembly, installation, commissioning and diagnostics of the relevant control block.

Datasheet – CPX-P maintenance tool

Function

The CPX Maintenance Tool (CPX-FMT) combines service software with a connecting adapter. The service software is a tool for the design, parameterisation and online diagnostics of the CPX-P terminal.

The USB-to-M12 adapter features built-in galvanic isolation (between CPX-P and PC) and enables a PC to be connected to the diagnostic interface of the CPX-P terminal.

- Adapter
- Software on CD-ROM

Application

Only from Festo

The CPX-FMT software enables access to CPX valve terminals via Ethernet with the bus nodes EtherNet/IP (FB 36) and PROFINET (FB 33, FB 34, FB 35). The bus nodes or control blocks can be connected directly to a PC via a USB adapter from Festo. Diagnostic data such as the error trace or module

diagnostics can be read out and parameters can be modified in plain text. The data can be used directly on a PC. There is an option, for example, to send screenshots of a configuration or the current error trace directly via email. In addition, CPX configurations can also be saved and archived

directly as a CPX-FMT project. Undocumented changes can subsequently be identified using the online/offline comparison function. On-site tests such as the actuation of valves or the emulation of sensor feedback (in both cases called "forcing"), for example, can be carried

out without an existing controller infrastructure. It must be noted that only local parameters on the CPX valve terminal can be changed and saved using the CPX-FMT. The configuration of the networks or controller software cannot be influenced.

Datasheet – CODESYS controller

- Industrial Ethernet
- TCP/IP
- EasyIP
- Web interface
- Email
- Data transfer

The CODESYS controller is a modern control system for CPX-P terminals that enables programming with CODESYS to IEC 61131-3.

The power supply to and communication with other modules takes place via the interlinking block.

In addition to network connections, LEDs are also provided for the bus status, operating status of the PLC and CPX-P peripherals information, as are switching elements and a diagnostic interface for CPX-FMT.

Application			
Bus connection		Communication protocols	Operating modes
The CPX-CEC is a remote controller that can be connected to a higher-order PLC via the bus nodes of the CPX-P terminal or via Ethernet. At the same time, it is	possible to operate the CPX-CEC as a compact stand-alone controller directly on the machine.	<ul style="list-style-type: none"> • Fieldbus via CPX-P bus nodes • Modbus/TCP • EasyIP 	<ul style="list-style-type: none"> • Stand-alone • Remote controller, fieldbus • Remote controller, Ethernet
Setting options			
The CPX-CEC has the following interfaces for monitoring, programming and commissioning:	<ul style="list-style-type: none"> • For the CPX-FMT • Ethernet interface for IT applications • Remote diagnostics 	The operating mode and fieldbus protocol are set using the DIL switch on the CPX-CEC.	The integrated web server offers a convenient means of querying data saved in the CPX-CEC.
Characteristics			
<ul style="list-style-type: none"> • Easy actuation of valve terminal configurations with MPA, VTSA • Diagnostics with flexible monitoring options for pressure, flow rate, cylinder operating time, air consumption 	<ul style="list-style-type: none"> • Activation of decentralised installation systems on the basis of CPI control of applications in proportional pneumatics • AS-Interface control via gateway 	<ul style="list-style-type: none"> • Connection to all fieldbuses as a remote controller and for pre-processing • Control of electric actuators as individual axes via CANopen (CPX-CEC-C1/-M1) 	<ul style="list-style-type: none"> • Early warnings and visualisation options • Servo-pneumatic applications

Datasheet – DeviceNet® bus node

Bus node for handling communication between the electrical terminal CPX-P and a DeviceNet® network.

The bus node is provided with system supply via the interlinking block and processes communication with the I/O modules.

The status of the CPX-P terminal is displayed as a common message via 4 CPX-P-specific LEDs.

The fieldbus communication status is displayed via the three DeviceNet-specific LEDs.

Application

Bus connection

The bus connection can be selected when ordering, either micro style as 2xM12 round plugs or open style as a terminal strip with IP20 protection.

Both connection types have the function of an integrated T-distributor with incoming and outgoing bus line.

DeviceNet® implementation

The CPX-FB11 operates with the Predefined Master/Slave Connection Set as a Group 2 Only Server.

The polled I/O, change of state or cyclic method is used for the transmission of cyclic I/O data. The type of transmission can be selected in the network configuration.

The device diagnostics for all bus nodes CPX-FB11 is effectively gathered via strobed I/O and displayed in the input table of the controller.

In addition to cyclic data transmission, acyclic communication is supported through explicit messaging, which enables detailed device diagnostics and parameterisation.

A comprehensive EDS file supports the display of acyclic data. It is also possible to display system information and assign parameters while the controller is running via the user program or the configuration software.

An example of this is access to the integrated diagnostic memory function, i.e. storage of the last 40 errors with timestamp, module, channel and error type.

With its address capacity of 64 byte inputs and 64 byte outputs, the CPX-FB11 supports any configuration of I/O modules, including pneumatic interface.

Points to note in connection with CPX-CEC

When a bus node is combined with a control block (CPX-CEC, in the fieldbus remote controller operating mode), the connected I/Os and/or valves, sensors and actuators are controlled via the CPX-P control block.

In this case, the bus node only provides the communication interface to the PLC.

Communication between the control block and CPX-P bus node takes place by linking the CPX-P modules and takes up the following address capacity in the CPX-P system:

- 8 byte outputs
- 8 byte inputs

The following address capacity remains in the control block or CPX-P system for activating the peripherals:

- 56 byte inputs
- 56 byte outputs

Datasheet – PROFIBUS bus node

Bus node for handling communication between the electrical terminal CPX-P and a higher-order master via PROFIBUS DP.

The bus node is provided with system supply via the interlinking block and processes communication with the I/O modules.

The status of the CPX-P terminal is displayed as a common message via 4 CPX-P-specific LEDs.

The fieldbus communication status is displayed via the PROFIBUS-specific error LED.

Application

Bus connection

The bus connection is established via a 9-pin Sub-D socket with a typical PROFIBUS allocation (to EN 50170).

The bus connector plug (with IP65/IP67 degree of protection from Festo or IP20 degree of protection from other manufacturers) facilitates the connection of an incoming and an outgoing bus cable.

An active bus terminal can be connected using the DIL switch integrated in the plug.

The Sub-D interface is designed for controlling network components with a fibre-optic cable connection.

PROFIBUS DP implementation

The CPX-FB13 supports the PROFIBUS DP protocol to EN 50170 Volume 2 for cyclic I/O exchange, parameterisation and diagnostic functions (DPV0).

In addition to DPV0, acyclic communication to the advanced specification DPV1 is supported. DPV1 provides acyclic access to advanced system information and allows parameterisation while the controller is running via the user program.

An example of this is access to the integrated diagnostic memory function, i.e. storage of the last 40 errors with timestamp, module, channel and error type.

With its address capacity of 64 byte inputs and 64 byte outputs, the CPX-FB13 supports any configuration of I/O modules, including pneumatic interface.

Points to note in connection with CPX-CEC

When a bus node is combined with a control block (CPX-CEC, in the fieldbus remote controller operating mode), the connected I/Os and/or valves, sensors and actuators are controlled via the CPX-P control block.

In this case, the bus node only provides the communication interface to the PLC. Communication between the control block and CPX-P bus node takes place by linking the CPX-P modules and takes up the following address capacity in the CPX-P system:

- 8 byte outputs
- 8 byte inputs

The following address capacity remains in the control block or CPX-P system for activating the peripherals:

- 56 byte inputs
- 56 byte outputs

Data sheet – CANopen bus node

Bus node for handling communication between the electrical terminal CPX-P and a CANopen network master or CANopen network.

The bus node is provided with system supply via the interlinking block and processes communication with the I/O modules.

The status of the CPX-P terminal is displayed as a common message via 4 CPX-P-specific LEDs.

The different CANopen statuses and the fieldbus communication status are visualised via 3 additional LEDs.

Application

Bus connection

The bus connection is established via a 9-pin Sub-D plug (pin) as per the CAN in Automation (CiA) specification DS 102 with additional 24 V CAN transceiver supply (option as per DS 102).

The bus connector plug (with IP65/ IP67 degree of protection from Festo or IP20 degree of protection from other manufacturers) facilitates the connection of an incoming and an outgoing bus cable.

There are 4 contacts available for the 4 wires (CAN_L, CAN_H, 24 V, 0 V) of the incoming and outgoing bus cables respectively.

CANopen implementation

The CPX-FB14 supports the CANopen protocol in accordance with the specifications DS 301 V4.01 and DS 401 V2.0.

Implementation is based on the CiA Predefined Connection Set.

There are 4 PDOs available for fast I/O data exchange.

Enhanced system information can also be accessed via SDO communication. SDO communication also facilitates parameterisation before network start-up or while the controller is running via the user program.

An example of this is access to the integrated diagnostic memory function, i.e. storage of the last 40 errors with timestamp, module, channel and error type.

With its address capacity, the CPX-FB14 supports a large number of I/O module configurations, including pneumatic interface.

By default, 8 byte digital inputs and 8 byte digital outputs can be addressed via PDO 1.

8 analogue input channels and 8 analogue output channels can be addressed via PDO 2 and 3. Status and diagnostic information can be evaluated via PDO 4.

Additional 8 byte digital inputs and outputs as well as 8 analogue input and output channels can be addressed via mapping.

Points to note in connection with CPX-CEC

When a bus node is combined with a control block (CPX-CEC, in the fieldbus remote controller operating mode), the connected I/Os and/or valves, sensors and actuators are controlled via the CPX-P control block.

In this case, the bus node only provides the communication interface to the PLC. Communication between the control block and CPX-P bus node takes place by linking the CPX-P modules and

takes up the following address capacity in the CPX-P system:

- 8 byte outputs
- 8 byte inputs

The following address capacity remains in the control block or CPX-P system for activating the peripherals:

- 56 byte inputs
- 56 byte outputs

Data sheet – PROFINET bus node, M12, D-coded

Bus node for operating the CPX-P valve terminal on PROFINET.

The bus node is provided with system supply via the interlinking block and processes communication with the I/O modules.

The status of the CPX-P terminal is displayed as a common message via 4 CPX-P-specific LEDs.

The fieldbus communication status is displayed via three bus-specific LEDs.

Application

Bus connection

The bus connection is established via two M12 sockets, D-coded to IEC 61076-2-101 with degree of protection IP65, IP67.

Both connections are equivalent 100BaseTX Ethernet ports with integrated auto MDI functionality (crossover and patch cables can be used) that

are brought together via an internal switch.

- Maximum segment length 100 m
- Transmission rate 100 Mbps

PROFINET implementation

The bus node supports the PROFINET protocol based on the Ethernet standard and the TCP/IP technology to IEEE802.3.

This guarantees a data exchange with a high data transmission rate, for example I/O data from sensors, actuators or robot controllers, PLCs or process

equipment. In addition, non-real-time critical information such as diagnostic information, configuration information, etc. can be transferred. The Ethernet bandwidth is sufficient to transfer both data types (real-time and non-real-time) in parallel.

The bus node features LEDs for bus status and CPX-P peripheral information as well as switch elements and a diagnostic interface. PROFINET provides the user with access to all peripherals, diagnostic data and parameter data of the CPX-P valve terminal. The bus node can be used as a remote

I/O or remote controller. All information relevant to the CPX-P can be read out and, depending on the function, changed via the diagnostic interface.

Points to note in connection with CPX-CEC

When a bus node is combined with a control block (CPX-CEC, in the fieldbus remote controller operating mode), the connected I/Os and/or valves, sensors and actuators are controlled via the CPX-P control block.

In this case, the bus node only provides the communication interface to the PLC. Communication between the control block and CPX-P bus node takes place by linking the CPX-P modules and

takes up the following address capacity in the CPX-P system:

- 8 byte outputs
- 8 byte inputs

The following address capacity remains in the control block or CPX-P system for activating the peripherals:

- 56 byte inputs
- 56 byte outputs

Data sheet – PROFINET bus node, push-pull RJ45

Bus node for operating the CPX-P terminal on PROFINET.
 The bus node is provided with system supply via the interlinking block and processes communication with the I/O modules.
 The status of the CPX-P terminal is displayed as a common message via 4 CPX-P-specific LEDs.
 The fieldbus communication status is displayed via three bus-specific LEDs.

Application

Bus connection

The bus connection is established via two RJ45 push-pull sockets to IEC 61076-3-106 and IEC 60603 with degree of protection IP65, IP67.

Both connections are equivalent 100BaseTX Ethernet ports with integrated auto MDI functionality (crossover and patch cables can be used) that

are brought together via an internal switch.

- Maximum segment length 100 m
- Transmission rate 100 Mbps

PROFINET implementation

The bus node supports the PROFINET protocol based on the Ethernet standard and the TCP/IP technology to IEEE802.3.

This guarantees a data exchange with a high data transmission rate, for example I/O data from sensors, actuators or robot controllers, PLCs or process

equipment. In addition, non-real-time critical information such as diagnostic information, configuration information, etc. can be transferred.

The Ethernet bandwidth is sufficient to transfer both data types (real-time and non-real-time) in parallel.

The bus node features LEDs for bus status and CPX-P peripheral information as well as switch elements and a diagnostic interface. PROFINET provides the user with access to all peripherals, diagnostic and parameter data of the CPX-P terminal. The bus node can be used as a remote I/O or

remote controller. All information relevant to the CPX-P can be read out and, depending on the function, changed via the diagnostic interface.

Points to note in connection with CPX-CEC

When a bus node is combined with a control block (CPX-CEC, in the fieldbus remote controller operating mode), the connected I/Os and/or valves, sensors and actuators are controlled via the CPX-P control block.

In this case, the bus node only provides the communication interface to the PLC. Communication between the control block and CPX-P bus node takes place by linking the CPX-P modules and

takes up the following address capacity in the CPX-P system:

- 8/16 byte outputs
- 8/16 byte inputs

The following address capacity remains in the control block or CPX-P system for activating the peripherals:

- 56/48 byte inputs
- 56/48 byte outputs

Datasheet – PROFINET bus node, push-pull SCRJ

Bus node for operating the CPX-P terminal on PROFINET.
 The bus node is provided with system supply via the interlinking block and processes communication with the I/O modules.
 The status of the CPX-P terminal is displayed as a common message via 4 CPX-P-specific LEDs.
 The fieldbus communication status is displayed via three bus-specific LEDs.

Application

Bus connection

The bus connection is established via SCRJ push-pull sockets to IEC 61754-24 (fibre-optic cable, AIDA standard) with degree of protection IP65, IP67.

The connections on the bus node are equivalent 100BaseFX Ethernet ports that are brought together via an internal switch.

Fibre-optic cables made from plastic (POF, 980/1000 µm) are also suitable for transmission.

- Maximum segment length 50 m
- Transmission rate 100 Mbps
- Supports LLDP and SNMP

PROFINET implementation

The bus node supports the PROFINET protocol based on the Ethernet standard and the TCP/IP technology to IEEE802.3.

This guarantees a data exchange with a high data transmission rate, for example I/O data from sensors, actuators or robot controllers, PLCs or process

equipment. In addition, non-real-time critical information such as diagnostic information, configuration information, etc. can be transferred.

The Ethernet bandwidth is sufficient to transfer both data types (real-time and non-real-time) in parallel.

The bus node features LEDs for bus status and CPX-P peripheral information as well as switch elements and a diagnostic interface. PROFINET provides the user with access to all peripherals, diagnostic and parameter data of the CPX-P terminal. The bus node can be used as a remote I/O or

remote controller. All information relevant to the CPX-P can be read out and, depending on the function, changed via the diagnostic interface.

Points to note in connection with CPX-CEC

When a bus node is combined with a control block (CPX-CEC, in the fieldbus remote controller operating mode), the connected I/Os and/or valves, sensors and actuators are controlled via the CPX-P control block.

Data sheet – EtherNet/IP bus node

- Industrial Ethernet
- EtherNet/IP
- Web

Bus node for handling communication between the electrical terminal CPX-P and the EtherNet/IP network.

The bus node is provided with system supply via the interlinking block and processes communication with the I/O modules.

The status of the CPX-P terminal is displayed as a common message via 4 CPX-P-specific LEDs.

Application

Bus connection

The bus connection is established via an M12 plug, D-coded to IEC 947-5-2 with degree of protection IP65, IP67.

EtherNet/IP is an open bus system based on the Ethernet standard and TCP/IP technology (IEEE802.3).

EtherNet/IP implementation

The CPX-FB36 supports the two operating modes: remote I/O and remote controller. In remote I/O operating mode, all functions of the CPX-P terminal are

directly controlled by the EtherNet/IP master (host). In addition to activation via a bus system, it is possible to use IT technologies. An integrated web server enables

diagnostic data to be visualised via HTML. Various programs support direct access to the device data from the automation network.

The EtherNet/IP node for CPX-P supports the transmission technology that conforms to DIN EN 50173/CAT 5 as an integrated interface.

Points to note in connection with CPX-CEC

When a bus node is combined with a control block (CPX-CEC, in the fieldbus remote controller operating mode), the connected I/Os and/or valves, sensors and actuators are controlled via the CPX-P control block.

In this case, the bus node only provides the communication interface to the PLC. Communication between the control block and CPX-P bus node takes place by linking the CPX-P modules and

takes up the following address capacity in the CPX-P system:

- 8 byte outputs
- 8 byte inputs

The following address capacity remains in the control block or CPX-P system for activating the peripherals:

- 56 byte inputs
- 56 byte outputs

Data sheet – EtherCAT® bus node

Bus node for operating the CPX-P terminal on EtherCAT®.

The bus node is provided with system supply via the interlinking block and processes communication with the I/O modules.

The status of the CPX-P terminal is displayed as a common message via 4 CPX-P-specific LEDs.

The fieldbus communication status is displayed via 4 bus-specific LEDs.

Application

Bus connection

The bus connection is established via two sockets M12x1, D-coded to IEC 61076-2-101 with degree of protection IP65, IP67.

Both connections are equivalent 100BaseTX Ethernet ports with integrated auto MDI functionality (crossover and patch cable can be used) that

are brought together via an internal switch.

- Maximum segment length 100 m
- Transmission rate 100 Mbps

EtherCAT® implementation

The CPX-FB37 supports the EtherCAT® protocol on the basis of the Ethernet standard and TCP/IP technology to IEEE802.3.

This guarantees a data exchange with a high data transmission rate, for example I/O data from sensors, actuators or robot controllers, PLCs or process equipment. In addition, non-real-time critical information such as diagnostic information, configuration information, etc. can be transferred.

The data bandwidth is sufficient to transfer both data types (real-time and non-real-time) in parallel. The bus node features LEDs for bus status and CPX-P peripheral information as well as switch elements and a diagnostic interface. The bus node can be used as a remote I/O or remote controller. All information relevant to the CPX-P can be read out and, depending on the function, changed via the diagnostic interface.

The functions MDP (modular device profile) and CoE (CAN over EtherCAT®) enable easy access to parameters and diagnostic data via EtherCAT.

Specific EtherCAT® functions:

- CoE (parameters and diagnostics or fail-safe mode): all module parameters can be set
- FoE (file over EtherCAT®) makes it possible to download firmware easily

- EoE (Ethernet over EtherCAT®): diagnostic data can be retrieved easily using a browser
- MDP (modular device profile): easy configuration using a module selection box
- Hot connect, easy replacement of an EtherCAT® CPX-P terminal
- DC (distributed clocks), time-synchronised data transmission

Points to note in connection with CPX-CEC

When a bus node is combined with a control block (CPX-CEC, in the fieldbus remote controller operating mode), the connected I/Os and/or valves, sensors and actuators are controlled via the CPX-P control block.

In this case, the bus node only provides the communication interface to the PLC. Communication between the control block and CPX-P bus node takes place by linking the CPX-P modules and

takes up the following address capacity in the CPX-P system:

- 8/16 byte outputs
- 8/16 byte inputs

The following address capacity remains in the control block or CPX-P system for activating the peripherals:

- 56/48 byte inputs
- 56/48 byte outputs

Data sheet – I-Port interface

The electrical interface CPX-P CTEL master establishes the connection to modules of the CTEL/CTEU series that have an I-Port interface (device). The I/O data from the connected devices are transmitted to the connected CPX-P bus node and thus to the higher-order controller via fieldbus. A maximum of 4 devices can be connected to a CPX-P CTEL master via suitable M12 interfaces.

Application

I-Port interface

As well as transmitting the communication data, the I-Port interfaces of a CPX-P CTEL master also transmit the power supply to the connected sensors

and the load supply to the valves (or outputs). Both circuits are supplied separately with 24 V, using a separate ground.

The connecting cables with a dual function as signal cable and supply cable must meet the corresponding increased requirements.

Configuration example – CPX-P CTEL master with CTEL modules

The CPX-P CTEL master provides 4 external I-Port interfaces, each of which can be connected to a device. I-Port is an interface for exchanging serial data for connecting decentralised modules or valve terminals from Festo. The I-Port interface is based on IO-Link® and is compatible with it in certain areas. The connection type corresponds to a star topology. In other words, only one module or valve terminal can be connected to each I-Port.

The limitations with respect to IO-Link® include:

- Permanently set baud rate of 230.4 kbps
- SIO mode is not supported
- Max. 32 bytes of input data and 32 bytes of output data
- Only one extract of the master commands is used
- Configuration via IODD is not supported.

Data sheet – I-Port interface

Implementation

The CPX-P CTEL master from Festo enables modules with an I-Port interface to be connected to a CPX-P system:

- Max. 4 devices with individual electronic protection
- Max. 64 inputs/64 outputs per I-Port interface
- The maximum length of a string is 20 m.

The following device variants are available:

- Input modules with 16 digital inputs (connection technology M8 3-pin and M12 5-pin)
- Valve terminals with I-Port interface (up to 48 solenoid coils, different valve functions)

The decentralised layout of the modules and valve terminals with I-Port enables them to be mounted close to the cylinders and actuators or sensors to be controlled. This means that the compressed air supply lines and sensor connecting cables used can be shortened, and it may be possible to use smaller valves, thereby saving costs.

Several CPX-P CTEL masters can be combined in one CPX-P terminal, depending on the address capacity of the bus node.

Example:

- CPX-FB13 (512 I/O)
- A maximum of 2 CPX-P CTEL masters is possible (each with 256 I/O)

Configuration

Settings

The precise number of the I/O bytes made available depends on the requirements of the connected devices or of the suitable selected operating mode.

The operating mode or preset configuration of the CPX-P CTEL master can be specified by the user.

Selecting the operating mode and setting the manual configuration takes place via the DIL switches. These DIL switches are not required during continuous operation and are only accessible in the disassembled state.

Manual configuration

In the case of manual configuration (tool change mode), the volume of inputs and outputs in the process image of the CPX-P system or of the higher-order fieldbus can be defined manually using the DIL switches.

The process image then always has the same scope, regardless of the connected devices.

The I/O length specified always applies to all four I-Ports (max. 8 bytes per I-Port).

Automatic configuration

In the case of automatic configuration, the I/O length for each I-Port is determined individually and this value is used to select the appropriate or next highest configuration preset.

Power supply for I-Port devices

The CPX-P CTEL master provides two separate power supplies for the connected devices:

- For operating the device and the inputs connected to it
- For the outputs and valves that are connected to the device

The power supply for the devices and the inputs is provided by the power supply for the electronics and sensors of the CPX-P terminal.

The power supply for the outputs and valves is provided by the power supply for the valves of the CPX-P terminal. The interlinking block with additional supply ensures a separate supply voltage for the valves and outputs. This

means it is possible to disconnect this supply voltage separately. The valves and outputs of the connected I-Port devices can therefore be disconnected separately without disconnecting the devices.

Datasheet – IO-Link® interface

The electrical interface CPX-CTEL-2-... enables the connection of modules with IO-Link® interface (IO-Link device) to the CPX-P terminal. The I/O data from the connected devices are transmitted to the connected CPX-P bus node and thus to the higher-order controller via fieldbus. A maximum of two IO-Link® devices can be connected to an electrical interface CPX-CTEL-2-... via the suitable M12 interfaces.

Application

IO-Link® interface

The communication system IO-Link® is used to exchange serial data from decentralised function modules (devices) at the field level. The electrical interface CPX-CTEL-2-... provides two external IO-Link® inter-

faces, each of which can be connected to a device. The connection type corresponds to a star topology, which means that only one device can be connected to each port.

The address space that the module makes available and assigns accordingly in the CPX-P system can be configured according to various presettings.

Selecting the operating mode and setting the manual configuration takes place via the DIL switches. These DIL switches are not required during continuous operation and are only accessible in the disassembled state.

Constraints

The interfaces (ports) of electrical interface CPX-CTEL-2-... support the connection of IO-Link® devices with few limitations.

- The process data length of the inputs and outputs is limited to 16 bytes each per port

- The driver strength on the C/Q line is limited to 250 mA

- SIO mode is not supported

Power supply for devices

The electrical interface CPX-CTEL-2-... provides two separate power supplies for the connected devices:

- For operating the device and the inputs connected to it

- For the outputs and valves that are connected to the device

The power supply for the devices and the inputs is provided by the power supply for the electronics and sensors of the CPX-P terminal.

The power supply for the outputs and valves is provided by the power supply for the valves of the CPX-P terminal. The interlinking block with additional supply ensures a separate supply voltage for the valves and outputs. This

means it is possible to disconnect this supply voltage separately. The valves and outputs of the connected I-Port devices can therefore be disconnected separately without disconnecting the devices.

Data sheet – Measuring module for displacement encoder

The measuring module CPX-CMIX is intended exclusively for use in the CPX-P terminal.

It offers movement and measurement in one, as an integral component of the terminal CPX-P – the modular peripheral system for decentralised automation tasks.

The modular design means that valves, digital inputs and outputs, positioning modules, end-position controllers and measuring modules, as appropriate to the application, can be combined in almost any way on the CPX-P terminal.

Advantages:

- Pneumatics and electrics – movement and measurement on one platform
- Innovative measurement technology – piston rod drives, rodless drives, rotary drives
- Actuation via fieldbus
- Remote maintenance, remote diagnostics, web server, text message and email alert are all possible via TCP/IP
- Modules can be quickly exchanged and expanded without altering the wiring

Datasheet – Input module, digital, NAMUR

Function

Digital input modules enable the connection of up to eight NAMUR sensors (or wired mechanical contacts). In addition, the first 4 channels can alternatively be used as counters or for frequency measurement.

M12 and terminal strip connection technology can be used, in either intrinsically safe or non-intrinsically safe design.

Application area

- Input modules for 24 V DC sensor supply voltage
- Module features can be parameterised
- The input module receives the voltage supply for the electronics and the sensors from the interlinking block
- Module protection and diagnostics through integrated electronic protection in each channel

 **Note**

The module CPX-P-8DE-N-IS has additional safety measures for possible errors, such as non-resettable fuses, to ensure safe operation in accordance with the ignition protection type. If the module is operated within the permissible parameters, these protective measures will be irrelevant.

 **Note**

Only the end plate, the pneumatic interface or another module in intrinsically safe design are permitted directly to the right of modules in intrinsically safe design (CPX-P-8DE-N-IS) within the CPX-P terminal.

 **Note**

The insulating plate CPX-P-AB-IP must be mounted between a module in intrinsically safe design (CPX-P-8DE-N-IS) and another, non-intrinsically safe CPX input or output module.

 **Note**

The above-mentioned certifications for the module CPX-P-8DE-N-IS do not apply if the module is used outside the appropriately configured CPX-P terminal.

Materials

Housing	Reinforced PA PC
Note on materials	RoHS-compliant
LABS (PWIS) conformity	VDMA24364 zone III

1) Component preferred for operation in intrinsically safe circuits.

Data sheet – Input module, digital

Function

Digital input modules enable the connection of two-wire and three-wire sensors (proximity switches, inductive or capacitive sensors, etc.).

Depending on the connection block selected, the module supports various connection concepts with different numbers of sockets (single or double allocation).

Application area

- Input modules for 24 V DC sensor supply voltage
- PNP or NPN logic
- Supports connection blocks with M12, M8, Sub-D and terminal connection
- Module features can be parameterised
- The input module receives the voltage supply for the electronics and the sensors from the interlinking block
- Module protection and diagnostics through integrated electronic protection

Data sheet – Input module, digital, PROFIsafe

Function

The PROFIsafe input module has 8 input channels whose signal status is detected for safety reasons, with the information transmitted to a suitable safety controller using the PROFIsafe safety protocol in combination with the appropriate fieldbus (PROFINET or PROFIBUS). This function is exclusively available for safety controllers using the PROFIsafe protocol, profile version 2.4.

Application area

- Input module for 24 V DC sensor supply voltage
- Supports connection blocks with M12 and terminal connection
- Module features can be parameterised
- The input module receives the voltage supply for the electronics and the sensors from the interlinking block
- Module protection and diagnostics through integrated electronic protection

Description

Module-based passivation

While channel-based passivation is disabled, the input module, in accordance with PROFIsafe specification, switches all information in the input

image to the safe status, even when there is only one channel error.

Channel-based passivation

In the case of channel-based passivation, when a channel error occurs, the input module switches the input information of the affected channel pair to 0, depending on the function mode.

- The input information for unaffected channel pairs does not change
- The input module remains integrated.
- The input module indicates the current channel error status to the control unit via the input image.

Possible applications

The inputs on the PROFIsafe input module can be combined for multi-channel sensor applications. Every two inputs form a channel pair, which is set separately with one of 11 function modes.

The function mode has an influence on the evaluation of the input signals, and optionally on the generation of clock signals.

There are five independent clock outputs available for safe operation of passive sensors; the pulse patterns are used in some operating modes to detect crossovers in the signal paths.

The entire input module is designed to ensure that the input channels provide either secure data or no data at all, even when there is an error present in the system

Application areas

- Use as an input module for a higher-order safety controller. Several input modules can be used together and these monitor mutually independent sensors
- Use of multi-channel sensor applications with up to 8 secure inputs, which can be grouped and are suitable for configuration with the help of 11 different function modes
- Connection of various switches and sensors within the safety chain

Note
The safety integrity level, Performance Level and category for the system as a whole correspond to that of the component in the safety chain with the lowest characteristic value.

Application examples

- two-hand control device for starting a function
- Emergency stop switch for incidents
- Operating mode selector switch with four positions
- Rotary indexing table
- Light curtain
- Acknowledge button with request
- End-position switch
- Safety door with two N/O switches

Datasheet – Output module, digital

Function

Digital outputs control actuators such as individual valves, hydraulic valves, heating controllers and many more. Separate circuits are created using additional power supply. By connecting the outputs of a module in parallel, consuming devices can be controlled with up to 4 A.

Application area

- Output module for 24 V DC supply voltage
- PNP logic
- Module features can be parameterised
- The output module receives the voltage supply for the electronics and the outputs from the interlinking block
- Module protection and diagnostics through integrated electronic protection in each channel

General technical data		CPX-4DA	CPX-8DA	CPX-8DA-H

Datasheet – Input/output module, digital

Application area

- Digital multi I/O module for 24 V DC supply voltage
- Supports connection blocks with Sub-D, terminal connection and M12 connection (8-pin)
- Module features can be parameterised
- The inputs receive the voltage supply for the electronics and the sensors from the interlinking block
- The outputs receive the voltage supply for the electronics and the outputs from the interlinking block
- Module protection and diagnostics through integrated electronic fuse protection for the sensor power supply and integrated electronic fuse protection in each output channel

General technical data			
Type		CPX-8DE-8DA	
No. of	Inputs	8	
	Outputs	8	
Max. power supply Per module	Sensor supply	[A]	0.7
	Outputs	[A]	4
Max. power supply per channel		[A]	0.5 (12 W lamp load, channels A0 ... A03 can be connected in parallel to A4 ... A7)
Fuse protection (short circuit)	Internal electronic fuse per channel		
Intrinsic current consumption at nominal operating voltage		[mA]	typ. 22
Operating voltage	Nominal width	[V DC]	24
	Permissible range	[V DC]	18 ... 30
Electrical isolation, inputs	Channel – channel	No	
	Channel – internal bus	No	
Electrical isolation, outputs	Channel – channel	No	
	Channel – internal bus	Yes, with intermediate air supply	
Characteristic curve	Inputs	IEC 1131-T2	
	Outputs	IEC 1131-T2	
Switching level, inputs	Signal 0	[V DC]	≤ 5
	Signal 1	[V DC]	≥ 11
Input debounce time		[ms]	3 (0.1 ms, 10 ms, 20 ms parameterisable)
Switching logic	Positive logic (PNP)		
LED indicators	Group diagnostics	1	
	Channel status	16	
Diagnostics	<ul style="list-style-type: none"> • Short circuit/overload per channel • Undervoltage of outputs 		
Parameterisation	<ul style="list-style-type: none"> • Input debounce time • Failsafe per channel • Forcing per channel • Idle mode per channel • Signal extension time • Module monitoring • Behaviour after short circuit 		
Degree of protection to EN 60529	Depending on the connection block		
Temperature range	Operation	[°C]	–5 ... +50
	Storage/transport	[°C]	–20 ... +70
Materials	Reinforced PA, PC		
LABS (PWIS) conformity	VDMA24364-B2-L		
Grid dimension		[mm]	50
Dimensions (including interlinking block and connection block) W x L x H		[mm]	50 x 107 x 50
Product weight		[g]	48

Datasheet – Counter module, digital

Function

The counter module has two channels. Depending on the parameterisation, these can independently be used as counter inputs or as incremental value encoder inputs or SSI. The counter module additionally has one output per channel. The outputs can either be controlled by a counter channel or an incremental value encoder channel, i.e. through an event such as "Comparative value reached". Alternatively, outputs can also be controlled via process data.

Application area

- Continuous counting
- One-off counting to count limit
- One-off counting to count limit, return to load value
- Periodic counting
- Measurement of frequencies
- Measurement of rotational speeds
- Measurement of duty cycle
- Measurement of position
- Measurement of speed
- Measuring with pulse generators
- Measurement with pulse generators and direction encoders
- Measurement with incremental encoders
- Measurement with SSI absolute encoders

Description

Possible applications

- Recording travel and speed of a conveyor
- Position and speed synchronisation of conveyors and pick & place applications
- Counting goods e.g. in packaging installations
- Systems for filling by weight and volume
- Monitoring motor speeds
- Measuring equipment for determining the position of axis systems (linear, rotational)
- Controlling fast-switching valves
- Controlling the opening time of a valve
- Activating semiconductor relays
- Temperature monitoring and rotational speed control for drives
- Change of direction in fast drives
- Control of motors with pulse-width modulation (PWM)

Supported devices

- 5 V incremental encoder, single-ended or differential, with two 90° phase offset tracks
- 24 V incremental encoder, single-ended, with two 90° phase offset tracks
- 24 V pulse generator with or without direction level
- 24 V direct current motors
- Absolute encoder with SSI interface (13 bits to 25 bits)

Datasheet – HART input/output module

Function

The HART input/output module allows the connection of up to 4 sensors or actuators. The corresponding communication channel is made available for sensors or actuators that communicate using the HART protocol.

With the HART protocol, a conventional analogue 4 ... 20 mA current signal is modulated by a second frequency-modulated signal.

Each of the 4 connections of the module can be configured as inputs or outputs.

Application area

- Multi I/O module for 24 V DC supply voltage
- Supports connection blocks with M12 and terminal connection
- Module features can be parameterised
- The module receives the voltage supply for the electronics, outputs and the sensors from the interlinking block
- Module protection and diagnostics through integrated electronic protection

General technical data			
Type	CPX-4AE-4AA-H		
Protocol	HART		
Number of selectable analogue inputs/outputs	4		
Type of sensor	0 ... 20 mA	4 ... 20 mA	4 ... 20 mA with HART
Operating voltage	Nominal width [V DC]	24	
	Permissible range [V DC]	18 ... 30	
Power failure buffering	[ms]	10	
Intrinsic current consumption at nominal operating voltage	[mA]	Typically 170	
Maximum short circuit current	[mA]	22	
Maximum open circuit voltage	[V]	28.8	
Minimum available sensor voltage	20.7 V DC at 20 mA		
Fuse protection (short circuit)	Internal electronic fuse per channel		
Reverse polarity protection	For all electrical connections		
Galvanic isolation	Channel – channel	No	
	Channel – internal bus	Yes	
Analogue input	0 ... 20 mA	4 ... 20 mA	4 ... 20 mA with HART
Data format	15 bits + prefix		
	Scalable to 15 bits		
Maximum load	[Ω]	750	
Maximum input resistance	[Ω]	300	
Maximum cable length	[m]	500	
Basic error limit at 25 °C	[%]	±0.1	
Operating error limit related to the ambient temperature range	[%]	±0.3	
Repetition accuracy	0.05% at 20 °C		
LED indicators	Group diagnostics	1

Datasheet – Input module, analogue

Function

Analogue modules are used to control devices with a standardised analogue interface such as pressure switches, temperature, flow rate, filling level, etc. Depending on the connection block selected, the analogue module supports various connection concepts with different numbers of sockets or terminals.

Application area

- Analogue module for 0 ... 10 V, 0 ... 20 mA or 4 ... 20 mA
- Supports connection blocks with Sub-D, terminal connection and M12 connection
- Analogue module features can be parameterised
- Different data formats available
- Operation with and without galvanic isolation possible
- The analogue module receives the voltage supply for the electronics and the sensors from the interlinking block
- Analogue module protection and diagnostics through integrated electronic fuse protection

Data sheet – Input module, analogue, with pressure sensors

Function

The pressure input modules make it possible to process a maximum of 4 pressures. The internal measured value of the sensor (analogue value with 10-bit resolution) is converted into an internal numerical format as appropriate to the parameterisation and made available to the bus node as a process image. It is additionally also possible to combine 2 channels in each case to form a differential pressure channel.

Application area

- Measuring range: 0 ... 10 bar or -1 ... +1 bar
- Choice of units of measurement
- Processing a maximum of 4 pressures per module
- Pressure indication via LCD display
- Direct connection via QS4 push-in connectors
- Error message via CPX-P
- Channel-oriented diagnostics

Datasheet – Input module, analogue, for temperature inputs

Function

The CPX-PT100 analogue input module with 4 channels for temperature measurement enables the connection of up to 4 temperature sensors of the type PT100-PT1000, Ni100-Ni1000, etc. The temperature module supports various connection concepts with different numbers of sockets or terminals as appropriate to the connection block selected.

Application area

- Temperature module for temperature sensors PT100, PT200, PT500, PT1000, Ni100, Ni120, Ni500, Ni1000
- Supports connection blocks with M12 and terminal connection
- Temperature module features can be parameterised
- 2-conductor, 3-conductor and 4-conductor connection
- The temperature module is provided with voltage supply for the electronics and the sensors via the interlinking block
- Temperature module protection and diagnostics through integrated electronic fuse protection

General technical data

Datasheet – Input module, analogue, for thermocouple

Function

The CPX-4AE-TC analogue input module with 4 channels for temperature measurement enables up to 4 thermocouple sensors to be connected.

The channels feature wire break and short circuit detection.

If no cold junction compensation sensor is being used, an internal theoretical value of 25 °C can be used (accuracy is impaired).

Application area

- Supports connection blocks with M12 and terminal connection
- Temperature module features can be parameterised
- 2-conductor connection
- 2-conductor connection for a PT1000 sensor for cold junction compensation
- The temperature module is provided with voltage supply for the electronics and the sensors via the interlinking block
- Temperature module protection and diagnostics through integrated electronic fuse protection

Datasheet – Output module, analogue

Function

Analogue modules are used to control devices with a standard analogue interface such as proportional valves, etc. Depending on the connection block selected, the analogue module supports various connection concepts with different numbers of sockets or terminals.

Application area

- Analogue module for 0 ... 10 V, 0 ... 20 mA or 4 ... 20 mA
- Supports connection blocks with Sub-D, terminal connection and M12 connection
- Analogue module features can be parameterised
- Different data formats available
- Operation with and without galvanic isolation possible
- The analogue module receives the voltage supply for the electronics and the actuators from the interlinking block
- Analogue module protection and diagnostics through integrated electronic fuse protection

Data sheet – PROFIsafe shut-off module

Function

The PROFIsafe shut-off module interrupts the contact rails of the interlinking block for valves and outputs. The supply voltage for valves can be switched by the module within the CPX-P terminal and via a connection block to two consuming devices. Actuation takes place via the bus node (PROFINET) of the CPX-P terminal.

Application area

- Output module for 24 V DC supply voltage
- Shut-off module for supply voltage for valves
- Can only be used with PROFINET or PROFIBUS bus nodes
- The shut-off module is supplied with voltage for the electronics and the outputs by the interlinking block
- The outputs are supplied from the power supply for valves (V_{Valves})

General technical data			
Type	CPX-FVDA-P2		
Number of outputs	2		
Note on outputs	1 internal channel for switching off the supply voltage for valves 2 external outputs

Datasheet – Interlinking block with system supply

Function

Interlinking blocks ensure the electrical supply of all other CPX-P modules. They have contact rails from which the other CPX-P components on the interlinking modules are supplied with current.

The internal division of the power supply makes it possible to switch off specific areas of the sensors and actuators individually.

Application area

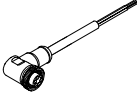

- 24 V DC supply voltage for electronics of the CPX-P terminal
- 24 V DC supply voltage for inputs
- 24 V DC supply voltage for valves
- 24 V DC supply voltage for outputs

Datasheet – Pneumatic interface for valve terminal MPA-S

Function

The pneumatic interface VMPA-FB establishes the electromechanical connection between the CPX-P terminal and the valve terminal MPA-S.

The signals from the bus node are forwarded to the control electronics in the electrical modules of the valve terminal MPA-S via the integrated CPX-P bus.

The bus signal for activating the solenoid coils is converted in the electronics module for max. 8 coils.

From a technical point of view, the individual MPA pneumatic modules each represent a separate electrical module with digital outputs. Galvanically isolated valves can be supplied with power via the interlinking block CPX-GE-EV-V.

Application area

- Interface to the valve terminal MPA-S
- Max. 128 solenoid coils
- Characteristics of the electronics module of the valve terminal MPA-S can be parameterised; for example, status of the solenoid coils in the event of fieldbus communication being interrupted (fail-safe), individual channel diagnostics can be activated, condition monitoring can be activated individually for each valve
- The pneumatic interface receives the voltage for the electronics and the supply voltage for the valves from the left interlinking block and feeds them through to the electronics modules of the valve terminal MPA-S
- Electronics modules of the valve terminal MPA-S:
 - Undervoltage of valves
 - Short circuit of valves
 - Open load of valves
 - Counter preset reached in condition monitoring

Accessories

Ordering data		Part no.	Type
Designation			
Connectors and accessories – Power supply			
	Power supply socket, straight	7/8" connection, 5-pin	543107 NECU-G78G5-C2
	7/8" power supply socket, 5-pin, angled socket	Open cable end, 5-pin	2 m 573855 NEBU-G78W5-K-2-N-LE5
Hood			
	Mounting rail for attaching the hood	1000 mm	572256 CAFC-X1-S
	Mounting kit for CPX hood		572257 CAFC-X1-BE
	Hood section for CPX-P terminal including mounting attachments for connecting several hood sections in series	200 mm	572258 CAFC-X1-GAL-200
		300 mm	572259 CAFC-X1-GAL-300
Screws			
	Screws for mounting the bus node/connection block on an interlinking block	Bus node/polymer connection block	550219 CPX-M-M3x22-4x
		Bus node/metal connection block	550216 CPX-M-M3x22-S-4x
Mounting			
	Attachment for wall mounting (for long valve terminals, 2 mounting brackets and 4 screws)	Version for metal manifold sub-bases	550217 CPX-M-BG-RW-2x
	Mounting for DIN rail		526032 CPX-CPA-BG-NRH
Function blocks			
	Terminating resistor, M12, B-coded for PROFIBUS		1072128 CACR-S-B12G5-220-PB
	Adapter M12, 5-pin to mini USB socket, and controller software		547432 NEFC-M12G5-0.3-U1G5
