Toothed belt axes ELGD-TB-WD

FESTO

Key features

At a glance

ELGD-TB (standard design)

- Profile with a square cross section and sturdy drive elements for high feed forces
- Suitable for the production of Li-ion batteries

ELGD-TB-WD (wide design)

- · Reduced profile height offers smaller installation dimensions for handling systems and applications that do not require such high feed forces
- 30% lighter, while rigidity and guide load capacity are still similar to the axis in the standard design
- Suitable for the production of Li-ion batteries

Innovative guide technology

- Excellent rigidity and load capacity of the guide for greater loads in the same installation space
- Less vibration and smoother slide movement protect sensitive workpieces
- High speeds ensure short cycle times and a very long service life minimises downtime

Powerful drive elements

- High feed forces and acceleration for shorter process times
- Long service life and increased reliability reduce TCO

Innovative stainless steel cover strip solution

- Abrasion-free and clean surface protects workpieces from particles
- Minimised number of particles for use in cleanrooms
- · Reduced ingress of dirt for use in harsh ambient conditions

Options:

- Extended or additional slide for higher axial and lateral torques and higher loads
- Two freely selectable motor positions at one end of the axis

Sealing air connection:

- Air is exchanged between the interior of the cylinder and the environment via the sealing air connection. This prevents negative pressure or excess pressure from building up inside the cylinder.
- Application of slight negative pressure prevents the emission of particles
- · Application of slight excess pressure prevents the ingress of particles

Engineering tools

More information → <u>electric-motion-sizing</u>

Save time with smart engineering tools for the optimum solution. Our goal is to increase your productivity. Our engineering tools play an integral part in achieving this goal. They help you size your system correctly, tap into unimagined productivity reserves and generate additional productivity along the entire value chain. In every phase of your project, from the initial contact to the modernisation of your machine, you will come across a great variety of useful tools.

Electric Motion Sizing

• Create the optimum drive package quickly and reliably. Electric Motion Sizing calculates suitable combinations of electric axis, electric motor and servo drive using just a few application details. It provides you with all the relevant data including the bill of materials and documentation for the selected combination. This avoids design errors and results in significantly improved energy efficiency for the system. A smooth connection to the Festo Automation Suite also makes commissioning easier for you.

Graphs

More information $\rightarrow \underline{\text{elgd-tb}}$

The graphs shown in this document are also available online. These can be used to display precise values.

Key features

Drive system

[TB] Toothed belt

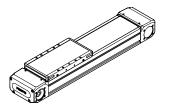

- For applications requiring a high dynamic response and short positioning times
- For long strokes

Stroke reserve

- The stroke reserve is a safety distance from the mechanical end position and is not used in normal operation.
- The sum of the stroke length and 2x stroke reserve must not exceed the maximum working stroke.

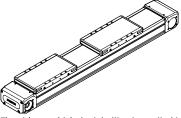

Slide design

[L] Long

Additional slide

[ZL] Lef

The side on which the labelling is applied is defined as the front.

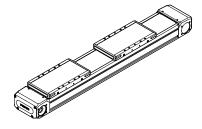

Lubrication

[] Standard

With lifetime lubrication. Lubrication nipple not included in delivery.

[ZR]

Right

[GN] Lubrication nipple

- The lubrication adapters enable the guide to be permanently lubricated using semi- or fully automatic relubrication devices
- The adapters are suitable for oils and greases

Toothed belt material

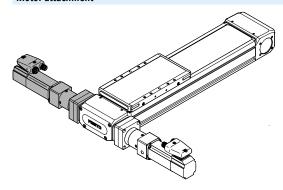

[PU2] Coated PU

- With steel reinforcements for high rigidity
- Fabric coating for a long service life and low abrasion
- Polyurethane material for resistance to many cooling lubricants

[PU1] Uncoated PU, FDA-compliant

- With steel reinforcements for high rigidity
- Blue, FDA-compliant polyurethane for use in the food industry

Motor attachment

- The motor can be attached to the left end of the axis at the front or rear.
- The position of the motor does not have to be specified when ordering and can be changed later
- Note: Unlike other axes from Festo, the motor cannot be mounted at both ends
 of the axis. However, the axis has a symmetrical design so that the left end can
 also be rotated to the right

tions		

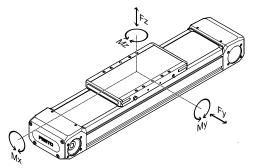

Materials

Axis	
Drive cover	Gravity die-cast aluminium, painted
Slide	Wrought aluminium alloy
Cover strip	High-alloy stainless steel
Toothed belt	
ELGDPU2	Polyurethane with steel cord and nylon cover
ELGDPU1	Polyurethane with steel cord
Guide	Steel
Profile	Anodised wrought aluminium alloy
Belt	High-alloy stainless steel
Note on materials	RoHS-compliant
LABS (PWIS) conformity	VDMA24364 zone III
Suitable for the production of Li-ion batteries	Metals with more than 1% by mass of copper, zinc or nickel are excluded from use. Exceptions are nickel in steel, chemically nickel-plated surfaces, printed circuit boards, cables, electrical plug connectors and coils

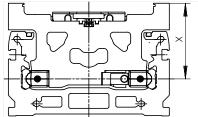

Load values

The indicated forces and torques refer to the centre of the guide. The point of application of force is the point where the centre of the guide and the longitudinal centre of the slide intersect. The appropriate size is selected using the following three steps:

- 1. Check the maximum permissible values (must not be exceeded)
- 2. Calculate the load comparison factor
- 3. Determine the service life

Distance from the slide surface to the centre of the guide

Distance from the slide surface to the centre of the guide		
Size		100
Dimension x	[mm]	47

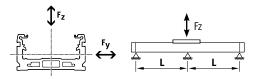

1. Check the maximum permissible values

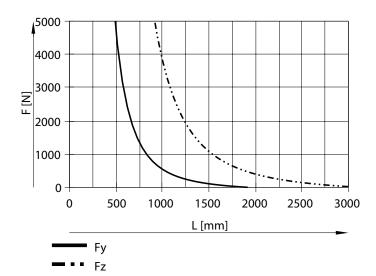

Max. permissible forces and torques for the overall axis (strength limits)			
Size		100	
Max. force Fy, overall axis	[N]	3236	
Max. force Fz, overall axis	[N]	2250	
Max. torque Mx, overall axis	[Nm]	168	
Max. torque My, overall axis	[Nm]	200	
Max. torque Mz, overall axis	[Nm]	200	

Maximum permissible support spacing L as a function of force F

The axis may need to be supported in order to limit deflection in the case of long strokes.

The following graphs can be used to determine the maximum permissible support spacing Ly as a function of force F acting on the axis. The deflection is f = 0.5 mm.

2. Calculate the load comparison factor

For a guide system to have a service life of 5000 km, the load comparison factor must have a value of $fv \le 1$, based on the maximum permissible forces and torques for a service life of 5000 km.

This formula can be used to calculate a guide value.

The engineering software "Electric Motion Sizing" is available for more precise calculations

→ www.festo.com/x/electric-motion-sizing

If the axis is subjected to several of the indicated forces and torques at the same time, the following equation must be satisfied in addition to the indicated maximum loads:

Calculating the load comparison factor:

$$f_v = \frac{\left| F_{y1} \right|}{F_{y2}} + \frac{\left| F_{z1} \right|}{F_{z2}} + \frac{\left| M_{x1} \right|}{M_{x2}} + \frac{\left| M_{y1} \right|}{M_{y2}} + \frac{\left| M_{z1} \right|}{M_{z2}} \leq 1$$

 F_1/M_1 = values occurring in the application

F₂ = permissible values at 5000 km from the graph "load support spacing"

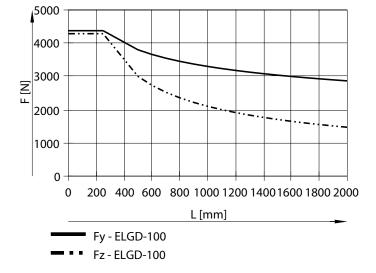

M₂ = maximum permissible values (see table)

Max. permissible torques for the guide calculation with reference service life		
Size		100
Reference service life	[km]	5000
Max. torque Mx	[Nm]	130
Max. torque My	[Nm]	200
Max. torque Mz	[Nm]	200

Max. permissible support spacing L as a function of the force F

Depending on how firmly the axis is supported, the maximum permissible forces vary due to the design of the guide system.

If the axis is used as a cantilever or in yoke operation, the values for a support spacing of 2000 mm can be selected.

3. Determine the service life

The service life of the guide depends on the load. To be able to provide an indication of the service life of the guide, the graph below plots the load comparison factor fv against the service life.

These values are only theoretical. You must consult your local Festo contact for a load comparison factor fv greater than 1.3.

Load comparison factor f_v as a function of service life l

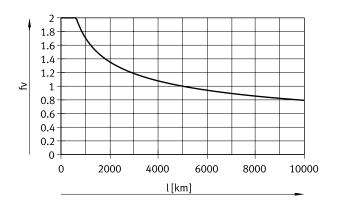

Example:

A user wants to move an x kg load. Using the formula (\rightarrow page 8) gives a value of 1.3 for the load comparison factor f_v . According to the graph, the guide would have a service life of approx. 2500 km. Reducing the acceleration reduces the Mz and My values. A load comparison factor f_v of 1 now gives a service life of 5000 km.

Note:

If the application has been calculated using "Electric Motion Sizing", the average guide comparison index represents the workload of the guide.

(100% average guide comparison index corresponds to fv = 1). With this value, the service life can be estimated using the service life graph

Comparison of the characteristic load values for 100 km with dynamic forces and torques of recirculating ball bearing guides

The characteristic load values of the bearing guides are standardised to ISO and JIS using dynamic and static forces and torques. These forces and torques are based on an expected service life of the guide system of 100 km to ISO or 50 km to IJS.

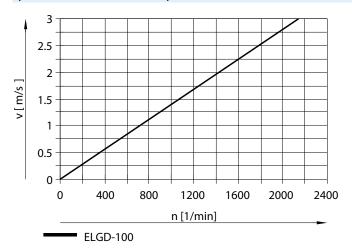

As the characteristic load values are dependent on the service life, the maximum permissible forces and torques for a 5000 km service life cannot be compared with the dynamic forces and torques of bearing guides to ISO/JIS.

To make it easier to compare the guide capacity of linear axes ELGD with bearing guides, the table below lists the theoretically permissible forces and torques for a calculated service life of 100 km. This corresponds to the dynamic forces and torques to ISO.

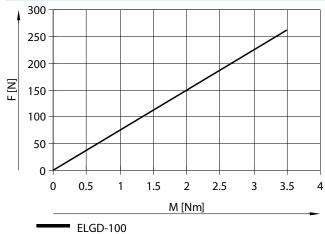

These 100 km values have been calculated mathematically and are only to be used for comparing with dynamic forces and torques to ISO. The drives must not be loaded with these characteristic values as this could damage the axes.

Max. permissible for	ces and torques for a the	oretical service life of 100 km (from a guide perspective only)
Size		100
Fy _{max} .	[N]	18415
Fz _{max}	[N]	18415
Mx _{max} .	[Nm]	645
My _{max.}	[Nm]	720
Mz _{max} .	[Nm]	720

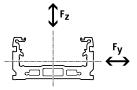

Speed v as a function of rotational speed n

Feed force F as a function of input torque M

Second moment of area

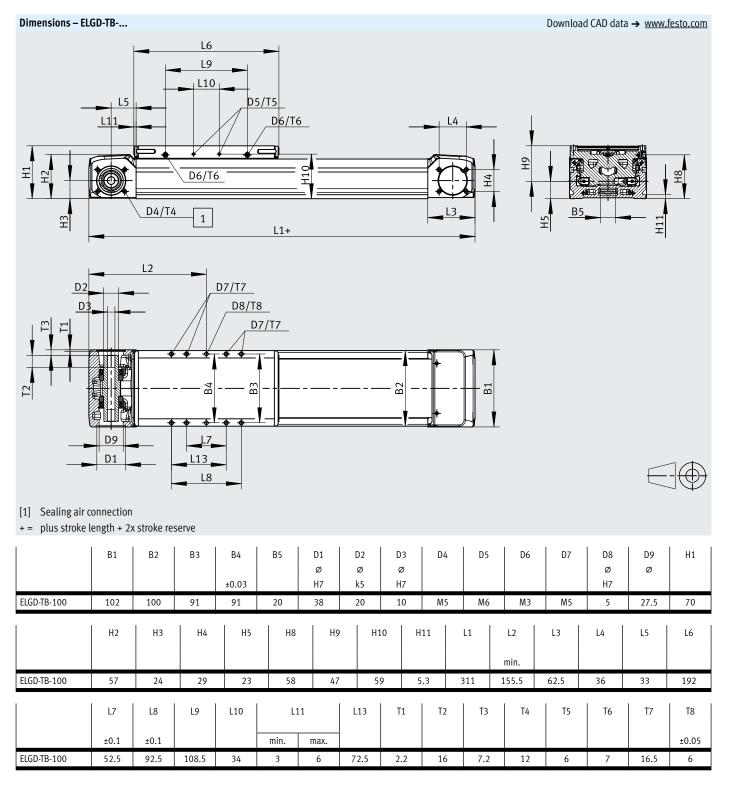

Size		100
ly	[mm ⁴]	0.347x10 ⁶
Iz	[mm ⁴]	2.268x10 ⁶

Recommended deflection limits

Adherence to the following deflection limits is recommended so as not to impair the functionality of the axes. Greater deformation can result in increased friction, greater wear and reduced service life.

Size	Dynamic deflection (load moves)	Static deflection (stationary load)
100	0.05% of the axis length, max. 0.5 mm	0.1% of the axis length
