Key features

FESTO

At a glance

The electric linear drive ELGL is a handling axis with air-bearing guide and integrated linear motor. The drive elements and the air bearing form a single unit. The slide moves on the stator rail. An integrated displacement encoder sends signals to the controller.

The displacement encoder, controller and motor operate in a closed-loop control circuit. This enables the motor to regulate to specified set values for speed and position within the permitted stroke range with a high degree of accuracy.

Advantages

- Highly accurate positioning and very good linearity thanks to the air bearing
- Integrated locking brake function through magnetic pretensioning of the air bearing
- Multiple carriages possible on one axis
- Opposing and synchronous movements possible
- No friction on the guide parts
- Maintenance and wear-free

The technology in detail

- [1] Mounting thread with centring recesses
- [2] Slide
- [3] Supply port for air bearing
- [4] Stator
- [5] End stop with rubber buffer, shock absorbers can alternatively be screwed in
- [6] Integrated displacement encoder
- [7] Sensor
- [8] Electrical interface, rotatable in steps of 90°
- [9] Mounting thread for foot mountings

Note

When using the linear axis, make sure that no dirt or dirt particles are sticking to the surface of the air bearing.

Invasive or hardened dirt can block the nozzles of the air bearing to the extent where they need to be replaced.

Compressed air backup for vertical operation

A pneumatic linear drive DGC-18 can be attached to the linear drive ELGL to protect the linear motor from overheating. The effective load is additionally held by the DGC when approaching the position by means of an appropriate backpressure in the DGC.

Static characteristic load values

The indicated forces and torques refer to the slide surface. The point of application of force is the point where the centre of the guide and the longitudinal centre of the slide intersect. These values must not be exceeded during dynamic operation. Attention must be paid to the acceleration and braking.

If the axis is simultaneously subjected to more than two of the indicated forces and torques, the following equation must be satisfied in addition to the indicated maximum loads:

$$\frac{|F_y|}{F_{y\max.}} + \frac{|F_z|}{F_{z\max.}} + \frac{|M_x|}{M_{x\max.}} + \frac{|M_y|}{M_{y\max.}} + \frac{|M_z|}{M_{z\max.}} \leq 1$$

Mounting options

The stator has an evenness value of 7 µm over 300 mm. To ensure the quality of the air bearing, the mounting surface must be correspondingly precise.

For points of support with smooth surfaces, the linear drive can be mounted directly at the stator [1] or with the help of the foot mountings [2].

If the surface is not sufficiently even, the foot mounting [3] is used together with the adjustable foot mounting [4].

A 3 or 4-point mounting is recommended to secure the load.
