## **FESTO**

Key features

#### At a glance

Movement and measurement in one, as an integral component of the valve terminal CPX – the modular peripheral system for decentralised automation tasks.

The modular design means that valves, digital inputs and outputs, positioning modules, end-position controllers and measuring modules, as appropriate to the application, can be combined in almost any way on the CPX terminal.

#### Advantages:

- Pneumatics and electrics movement and measurement on one platform
- Innovative measurement technology piston rod drives, rodless drives, rotary drives
- · Actuation via fieldbus
- Remote maintenance, remote diagnostics, web server, SMS and e-mail alert are all possible via TCP/IP
- Modules can be quickly exchanged and expanded without altering the wiring

### Retracting/advancing and measuring in one work step

Fully digital data acquisition and transmission means pneumatic cylinders can now be used as sensors. With very high repetition accuracy and incorporating both analogue and digital measuring sensors.

#### Time and space-saving

Electrical peripherals enable the highly efficient measuring module to be seamlessly and compactly integrated into existing control environments. The new component is tailored to the proven CPX system and can be commissioned quickly and easily.

#### Process reliability

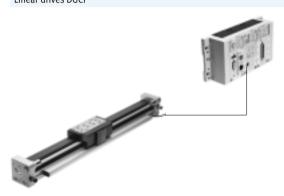

All process steps are measured and documented, which significantly improves quality. The adjustable contact force (via pressure regulator) also increases the precision of the "displacement sensor".

#### Reduced system costs

As with all modules in the electrical terminal CPX, easy functional integration in fieldbus/Ethernet networks is a matter of course.

#### Drives to use

Linear drives DGCI

- The measurement signal of the linear drive DGCI supplies a CAN signal, which is read in directly into the CPX-CMIX module
- The measuring system measures absolute values, in other words the actual position is immediately available for the controller after the system is switched on

Technical data		
Linearity error <sup>1)</sup>	[%]	< ±0.02, min. ±50 μm
Resolution	[mm]	0.01
Repetition accuracy <sup>2)</sup>	[mm]	±0.01/±0.02
Hysteresis	[µm]	< 4
Maximum temperature coefficient	[ppm/°K]	15
Smallest measurable speed	[mm/s]	10

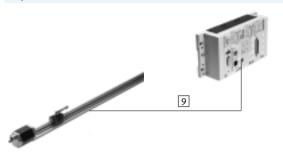

- Always refers to max. stroke.
- 2) Stroke  $\leq$  1000 mm/stroke > 1000 mm

**FESTO** 

Key features

#### Drives to use

Displacement encode MME

- The measurement signal of the displacement decoder MME supplies a CAN signal, which is read in directly into the CPX-CMIX module
- The measuring system measures absolute values, in other words the actual position is immediately available for the controller after the system is switched on

Technical data		
Linearity error <sup>1)</sup>	[%]	< ±0.01, min. ±40μm
Resolution	[mm]	0.01
Repetition accuracy <sup>2)</sup>	[mm]	±0.01/±0.02
Hysteresis	[µm]	< 4
Maximum temperature coefficient	[ppm/°K]	15
Smallest measurable speed	[mm/s]	10

- Always refers to max. stroke.
- 2) Stroke ≤ 1000 mm/stroke > 1000 mm

#### Linear drives DNCI

- The measuring signal of the linear drive DNCI is an incremental signal, which is converted to a CAN signal in the sensor interface CASM-S-D3-R7. The converted signal is then read into the CPX-CMIX
- The measuring system does not measure absolute values, so must be homed after it is switched on.
   The actual position is available for the controller once this has been done

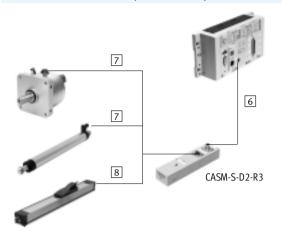

Technical data		
Linearity error		
Strokes up to 500 mm	[mm]	< ±0.08
Strokes up to 1000 mm	[mm]	< ±0.09
Strokes over 1000 mm	[mm]	< ±0.11
Resolution	[mm]	0.01
Repetition accuracy	[mm]	<±0.02
Hysteresis	[mm]	< 0.03
Smallest measurable speed	[mm/s]	10

Key features

#### Drives to use

Swivel modules DSMI, standard cylinders DNCM or potentiometers MLO-POT

- The measuring systems supply an analogue measuring signal, which is converted to a CAN signal in the sensor interface CASM-S-D2-R3.
   The converted signal is then read into the CPX-CMIX
- Potentiometers measure absolute values, in other words the actual position is immediately available for the controller after the potentiometer is switched on

Other potentiometers can be used, in which case the following must be noted:

- The connection resistance of the potentiometer must be 3 ... 20  $k\Omega$
- Poorer potentiometer values for linearity and temperature coefficient will decrease the accuracy of the measured value
- A special cable must be used for connection to the sensor interface
