Gear couplings EAMD, with expanding mandrel

→ 10

- Three-piece couplings are suitable for force-locked and backlash-free transmission of high torques between electric motors and axes
- System product for positioning technology
- Outside diameter 16, 19, 25, 32, 42, 56, 67 mm

Connecting shafts KSK

→ 13

Electric axes are often combined to form multi-axis systems. It is particularly important when designing gantry systems with a long gantry axis and

heavy loads that the two basic axes be driven synchronously. For these systems, two axes with toothed belt

drive are generally coupled with a shared motor and synchronised using a connecting shaft.

Range of applications:

- For synchronising toothed belt axes DGE and EGC
- For torsion-resistant transmission of the necessary torque
- For slip-free transmission of an identical feed speed
- For compensating tolerances and alignment errors between two axes

Technical data for toothed belt axis:
DGE-ZR-KF → 14
EGC-TB-KF → 16

Nominal length L1 = Centre-to-centre distance between the axes

The total mass is calculated as follows:

$$m_{\text{total}} = m_0 + m_L \times L1$$

The moment of inertia is calculated as follows:

$$J_{\text{total}} = J_0 + J_L \times L1$$

1) Centre-to-centre distance between the axes

Note

The nominal length L1 must be specified in the type code when ordering. The nominal length L1 indicates the centre-to-centre distance between the axes in this case.

Order example:

Two toothed belt axes DGE-40-...-ZR-KF are to be linked using a connecting shaft, nominal length L1 = 1,000 mm.

The following connecting shaft is required:

Type: KSK-40-1000
Part No.: 196 588

Connecting shafts KSK
for toothed belt axis EGC-TB-KF

Ø - Size
50, 70, 80, 120 and 185

Nominal length L1 = Inside width
between the drive covers

The total mass is calculated
as follows:

$$m_{\text{total}} = m_0 + m_L \times L1$$

The moment of inertia is calculated
as follows:

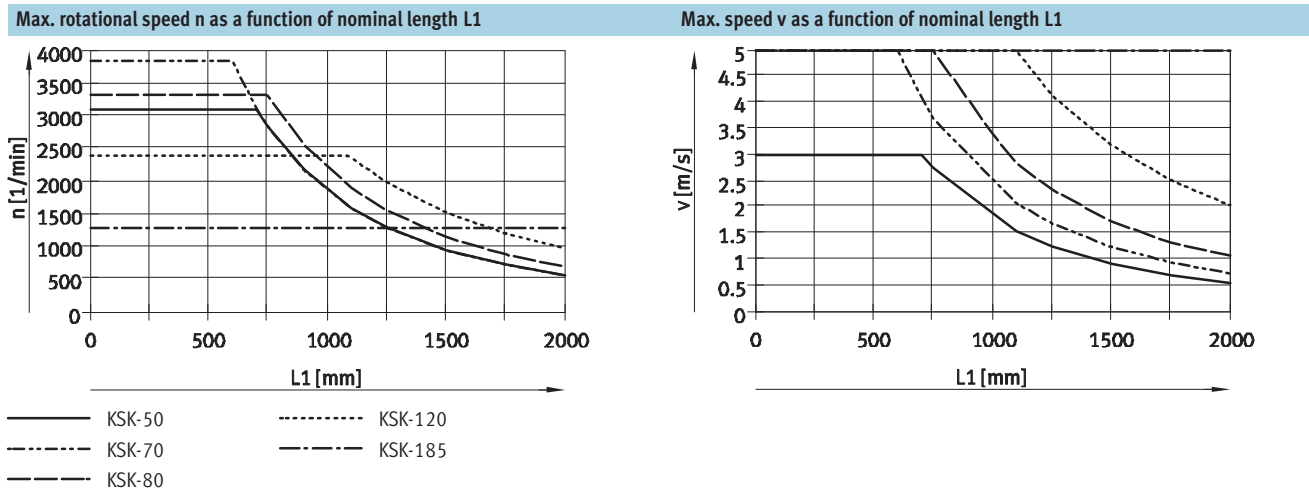

$$J_{\text{total}} = J_0 + J_L \times L1$$
