Valve terminals CDVI, Clean Design

**FESTO**

Valve terminals CDVI, Clean Design

Key features

Innovative

- Proven valve technology combined with a highly resistant polymer material
- Modular structure with 4 or 8-valve basic block
- Extension modules with 1 and 2 valve positions
- Extension modules with 1 and 2 valve positions with separate electrical (fieldbus only) and/or pneumatic additional supply
- Multi-pin plug connection
- Fieldbus connection
- Additional valve terminals and I/O modules can be connected via a CP string extension.
  Additional information
  → Internet: ctec

Versatile

- 4 … 16 valve positions
- Max. 24 solenoid coils
- Standardised from the individual valve up to multi-pin plug and fieldbus connections
- Flow rates from 300 … 650 l/min
- Valve width 24 mm
- 1 … 9 electrical voltage zones
- 1 … 9 pneumatic pressure zones

Reliable

Developed with practical considerations in mind

- Hygienic
- Corrosion resistant
- Easy to clean

Easy to mount

As is the case with all Festo products, all CDVI and CDSV are fully pre-assembled and equipped according to customer requirements

- With QS…-F fittings on the working lines and end plates
- Tested for electrical and pneumatic functions

Valve terminals CDVI, Clean Design

Key features

CDVI – The requirements

The food industry has stricter hygiene requirements than any other sector. There can therefore be no compromise when it comes to easy cleaning and corrosion resistance.

Result: the CDVI.
Developed in close consultation with leading names from the food and packaging industry, the CDVI represents a totally new valve terminal solution for splash zones. The Clean Design valve terminal CDVI has a revolutionary corrosion-resistant and easy-to-clean design that makes it stand out from its competitors.

CDVI – The solution

The new Clean Design
Valve terminal CDVI – simply a neat solution
Apart from reduced cleaning times, the CDVI also takes less time to install and assemble. Stainless steel control cabinets have become a thing of the past and the electrical connection is now established using the pre-fitted, ready to connect cable. The valve terminal is, of course, supplied fully assembled and in particular tested ex works to IP65, IP66, IP67 and NEMA 4.
This results in minimal installation time.
The valve terminal includes common supply ports and exhausts for all

valves. The common lines are connected to the end plates.
The CDVI is available with four or eight valve positions in the basic designs and can optimally be extended up to 16 valve positions in grids of one or two, taking into consideration the maximum number of coils. Appropriate expansion blocks are used for this.

Individual sub-base
An individual sub-base for Clean Design valves (Clean Design Single Valve – CDSV) rounds off the lower end of the product range so that even upstream machines and system components can be incorporated into the Clean Design concept.

Clean in theory and practice – the CDVI
The requirements for the hygienic design of machine components to DIN EN 1672-2 and DIN ISO 14159 have been implemented in the CDVI. They are easy to clean thanks to:
• no sharp edges
• no small radii
• no crevices where dirt can gather
• space between the valves for easy cleaning
• corrosion-resistant materials

The CDVI can be cleaned using special cleaning agents that are compatible with aluminium, available from the following manufacturers
• Henkel
• Ecolab
• Johnson Diversy
• Kärcher

Certified cleanliness
The CDVI is certified to HACCP.

Valve terminals CDVI, Clean Design

Key features

Reduced downtimes:
On-the-spot diagnostics via LEDs

Width 24 mm

Simple electrical connections:
– Multi-pin plug connection with
  pre-assembled cable
– Fieldbus connection, operating
  voltage and CP string extension

Functional:
Robust metal thread or
pre-assembled QS-F fittings

Fast assembly

Flexible:
– Max. 16 valve positions
  with max. 24 solenoid coils
– 1 ... 9 electrical voltage zones
– 1 ... 9 pneumatic pressure zones

Comprehensive range of valve functions

Reliable operation:
Non-detenting manual override

Modular:
– Creation of pressure zones
– Extension modules with 1 and 2 valve positions
  also with separate electrical (fieldbus only) and/or
  pneumatic additional supply

Equipment options

Valve functions

- 2/2-way valve, normally closed
- 2/2-way valve, normally open
- 3/2-way valve, normally closed
- 3/2-way valve, normally open

- 2x 3/2-way valve, normally closed
- 2x 3/2-way valve, normally open
- 2x 3/2-way valve, 1x normally
  open, 1x normally closed

- 5/2-way valve, single solenoid
- 5/2-way valve, double solenoid

- 5/3-way valve, mid-position closed
- 5/3-way valve, mid-position
  pressurised
- 5/3-way valve, mid-position
  exhausted

Special features

Individual valve
- Electrical connection via multi-pin
  cable

Multi-pin terminal
- Max. 16 valve positions
- Max. 24 solenoid coils
- Compressed air supply possible via
  both end plates as well as power
  supply module
- 1 ... 9 pressure zones
- Detergent resistant PVC cable
  already assembled
- Cable length 5 m or 10 m

Fieldbus terminal
- Max. 16 valve positions
- Max. 24 solenoid coils
- Compressed air supply possible via
  both end plates as well as power
  supply module
- 1 ... 9 pressure zones
- 1 ... 9 voltage zones
- Enhanced diagnostic function
- Easy to clean connections at the
  rear

CP string extension
- Additional valve terminals or
- Electrical I/O modules.

- Resilience
- Corrosion resistance class
- Ease of cleaning

Valve terminals CDVI, Clean Design
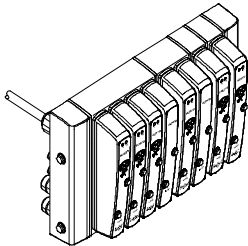

Key features

Individual connection

Valves can also be used on individual sub-bases for actuators further away from the valve terminal.

The electrical connection is established via a 10 m pre-assembled PVC cable.

Multi-pin plug connection

Control signals from the controller to the valve terminal are transmitted via a pre-assembled multi-wire cable or a self-assembly multi-pin plug connection, which substantially reduces installation time.

Valve terminals with multi-pin plug connections can be equipped with 4 to 16 valve positions with max. 24 solenoid coils.

Designs
- Multi-pin cable, 5 m long, pre-assembled with open wire ends
- Multi-pin cable, 10 m long, pre-assembled with open wire ends

Fieldbus connection
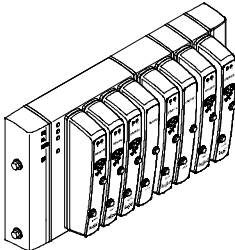

An integrated fieldbus node manages the communication connection to a higher-order PLC. This enables a space-saving pneumatic and electronic solution.

Valve terminals with fieldbus interfaces can be equipped with 4 to 16 valve positions with max. 24 solenoid coils.

Designs
- DeviceNet connection 2x M12
- Ethernet Powerlink on request

-¦- Note

The basic blocks of the valve terminals can be extended by a maximum of 8 valve positions. The extension modules used are of no relevance here.

➜ Internet: www.festo.com/catalogue/...

CP string extension

The optional string extension enables an additional valve terminal and I/O modules to be connected to Fieldbus Direct. A CP string of the CPI installation system is integrated in the fieldbus node as an extension. Different input and output modules as well as CPV and CPA valve terminals can be connected.

The maximum length of the CP string extension is 10 metres, which means that the extension modules can be mounted directly on-site. All of the required electrical signals are transmitted via the CP cable, which in turn means that no further installation is needed on the extension module.

The CP string interface offers:
- 16 input signals
- 16 output signals for output modules 24 V DC or solenoid coils
- Logic and sensor supply for the input modules
- Load voltage supply for the valve terminals
- Logic supply for the output module

Overview – Clean Design valve terminal
Individual sub-base

		Brief description	➜ Page/Internet
1	Mounting kit	Mounting from above or below	34
2	Sub-base for individual valve	–	31
3	Individual electrical connection	–	–
4	Push-in fitting	For working lines	34
5	Push-in fitting	For pilot air supply and venting, venting hole	34
6	Push-in fitting	For compressed air supply and venting	34
7	Valve	–	31
8	LED display	–	–
9	Manual override	For each solenoid coil, non-detenting	–

All valves on the valve terminal CDVI can be assembled on the individual sub-base CDSV. The individual sub-base CDSV has a connection for external pilot air supply, is pre-assembled with valve and 10 m PVC cable and is fully inspected before shipment.

Assembled push-in fittings included on request. A Clean Design mounting kit comprising two screws (18 mm and 40 mm) and two stainless steel blanking plugs permits mounting from above or below. If you have included fittings with your order, the pressure compensation hole is also equipped with a QS fitting.
The collected exhaust air from the pilot solenoid coils of the valves is drawn off via the pressure compensation hole (venting hole) on the rear side.

- ᵻ - Note

All ports and mounting holes that are not required must be sealed with a blanking plug.
Exception: venting hole

Overview – Clean Design valve terminal
Valve terminal with multi-pin plug connection

		Brief description	➔ Page/Internet

Valve terminals CDVI, Clean Design

Key features – Pneumatic components

Modularity

Consistently modular valve terminal in a grid of 4 … 16 valve positions/ 8 … 24 solenoid coils.
See sample representation on right.

4 + 2 + 2 valve positions

8 + 2 + 2 valve positions

8 + 2 + 1 + 1 valve positions

Pilot air supply

The valves used are pneumatically piloted solenoid valves.
The ports on the valve terminal different for the following pilot air supply types:
• internal pilot air supply
• external pilot air supply

The pilot air supply duct 12/14 is supplied from the duct 1 supply air (internal pilot air supply) or via a separate pilot air supply in the left-hand end plate (external pilot air supply).

A separate pilot air supply is required in any event if supply pressure is less than 3 bar or greater than 8 bar.
In this case it is advisable to restrict the pilot air supply to max. 8 bar with a suitable regulator.

The pilot air supply is selected by including a corresponding code letter in the order code (end plates/ compressed air supply code U, V, Y, Z).

Pneumatic pressure zones

CDVI offers a number of options for creating pressure zones, if different working pressures are required.

Pressure zones are created by isolating the internal supply ducts between the basic block and extension module or by using extension modules with separate supply ports with an appropriate separator plate.

A maximum of two different pressure zones can be created on valve terminals with one extension module without separate supply port. The compressed air is supplied at both ends through the end plates.
Up to three different pressure zones can be created on valve terminals with two extension modules. In this case, the compressed air is supplied via the two end plates as well as via the first extension module with separate supply port.

If more than three pressure zones are required, extension modules with a separate supply port must be used.
Up to nine pressure zones are possible taking into consideration the maximum valve positions and number of coils. In this case, the compressed air is supplied via the two end plates as well as via the separate supply ports of the respective extension modules.

Separator plates are integrated ex-works as per your order. Separator plates can be distinguished through their coding, even when the valve terminal is assembled.
A label on the right-hand end plate makes it easier to allocate the separator plates when the valve terminal is assembled.

Separator plates

Pictorial examples	Coding	Notes	
		Separator plate No duct separation	
		Separator plate Duct 1 separated Ducts 3 and 5 open	
		Separator plate Duct 1 open Ducts 3 and 5 separated	- ▮ - Note Normally only duct 1 is closed. Ducts 3 and 5 or 1, 3 and 5 can also be closed for special applications.
		Separator plate Ducts 1, 3 and 5 separated

Subject to change – 2012/05

Examples: Compressed air supply and pilot air supply

Internal pilot air supply

Code U, Y

The diagram opposite shows an example of the configuration and con-nection of the compressed air supply with internal pilot air supply. Port 12/14 on the left-hand end plate is tightly sealed. The pilot air is supplied internally via the right-hand end plate.

Separator plates can be used optionally to create pressure zones.

Optional separator plate

CDVI5.1-DZ   CDVI5.1-DZP   CDVI5.1-DZR   CDVI5.1-DZPR
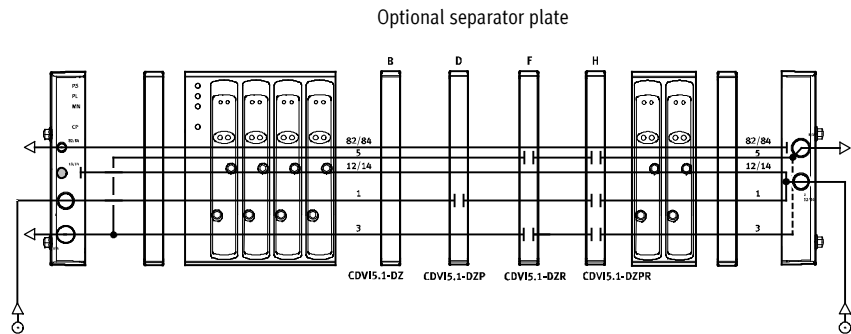

External pilot air supply

Code V, Z

The diagram opposite shows an example of the configuration and con-nection of the compressed air supply with external pilot air supply. Port 12/14 on the left-hand end plate is equipped with a fitting for this purpose.

Separator plates can be used optionally to create pressure zones. In this case it is advisable to restrict the pilot air supply to max. 8 bar with a suitable regulator.

Optional separator plate

CDVI5.1-DZ   CDVI5.1-DZP   CDVI5.1-DZR   CDVI5.1-DZPR
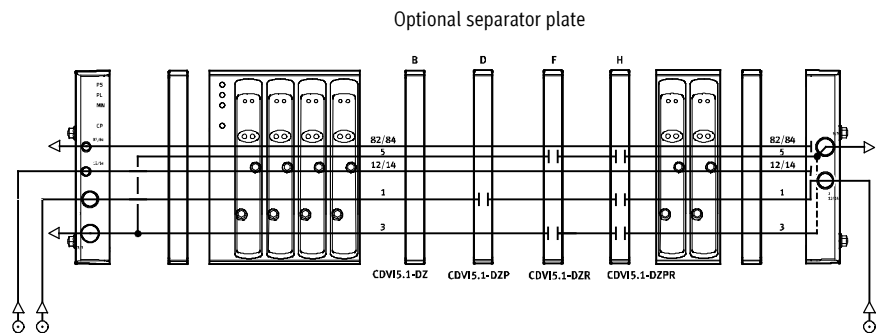

Creation of pressure zones

The CDVI facilitates the creation of up to 9 pressure zones. The diagram opposite shows an example of the configuration and connection of three pressure zones using separator plates with an external pilot air supply of 3 ... 8 bar.

Zone 1   Zone 2   Zone 3

CDVI5.1-DZ   CDVI5.1-DZP   CDVI5.1-DZPR   CDVI5.1-DZ

Pilot air supply P_1

Key features – Pneumatic components

Mounting
Individual sub-base

[2]

[1]

[2]

[1]
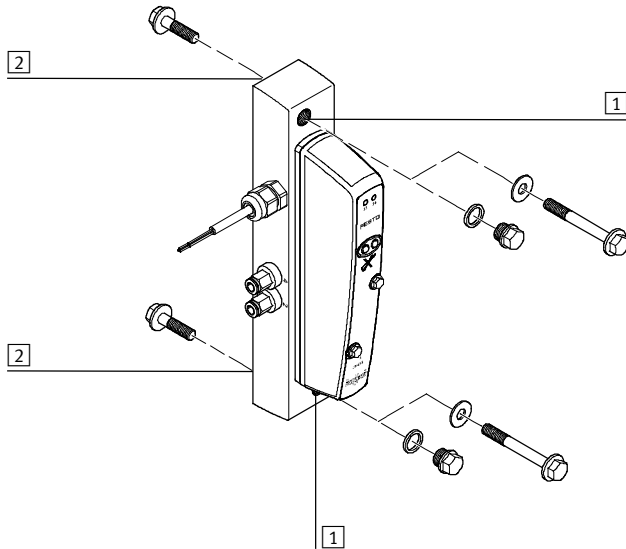

[1] Hole for front mounting (CDSV) using M6 screws; the hole can be covered with blanking plug G⅛ if not required
[2] Hole for rear mounting (CDSV) using M6 screws

Valve terminal
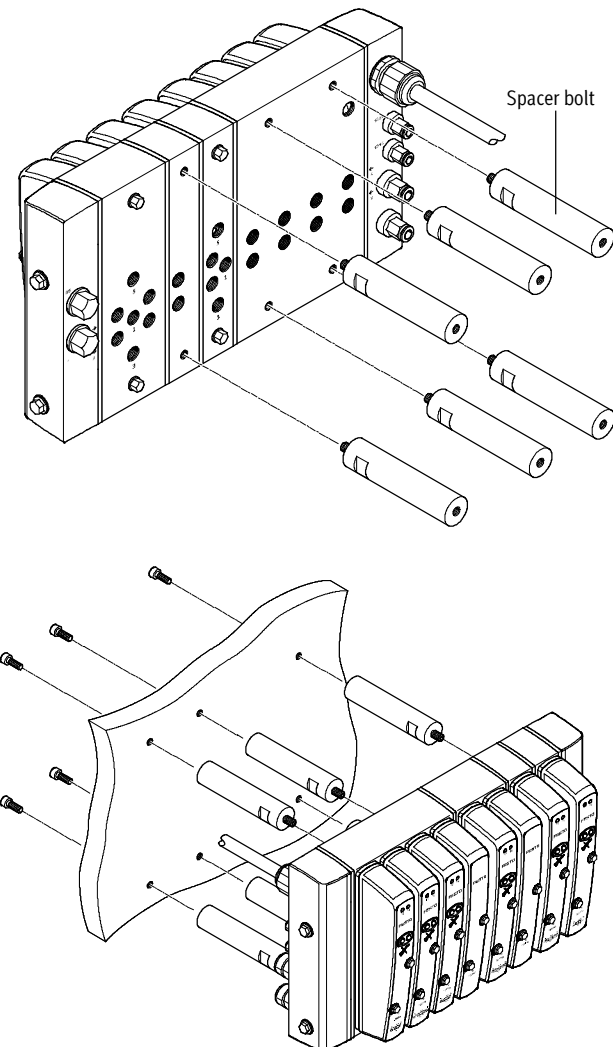

Spacer bolt

The CDVI can be mounted directly on earthed mounting surfaces using the four threaded holes in the basic block and the spacer bolts ordered via the order code (accessories order code Y).

The CDVI can be mounted in any position. However, the selected mounting position should allow for the cleaning off of dirt and the draining of cleaning agent.

- ⬛ - Note

If extension modules are added to the valve terminal at a later stage, the following points must be observed:
- Basic block:
  Always attach using 4 spacer bolts
- Extension modules:
  After the second module, max. 4 extension modules between 2 attachment points
- Appropriate screw kit for attaching the extension modules to the basic block (page 34)

1) Max. 24 solenoid coils
2) To IEC 757
3) 0 V for positive switching control signals; connect 24 V for negative switching control signals; mixed operation is not permitted.
4) This core is not used and can be cut off.

Valve terminals CDVI, Clean Design

Key features – Electrical components

Address allocation – Valves with multi-pin plug

A valve position on the CDVI valve terminal always occupies 2 addresses on the basic block, even if one of these is equipped with a blanking plate.

Addresses should be assigned in ascending consecutive order. The numbering goes from left to right.

A valve terminal extension occupies 2 addresses on an extension module for 1 valve position and 4 addresses on an extension module for 2 valve positions.

If the extension module is additionally configured with the option T (only one solenoid coil per valve position), only one address is occupied per valve position.

Example: Address allocation for a CDVI valve terminal with a basic block with 8 valves and 2 extension modules for 2 valve positions
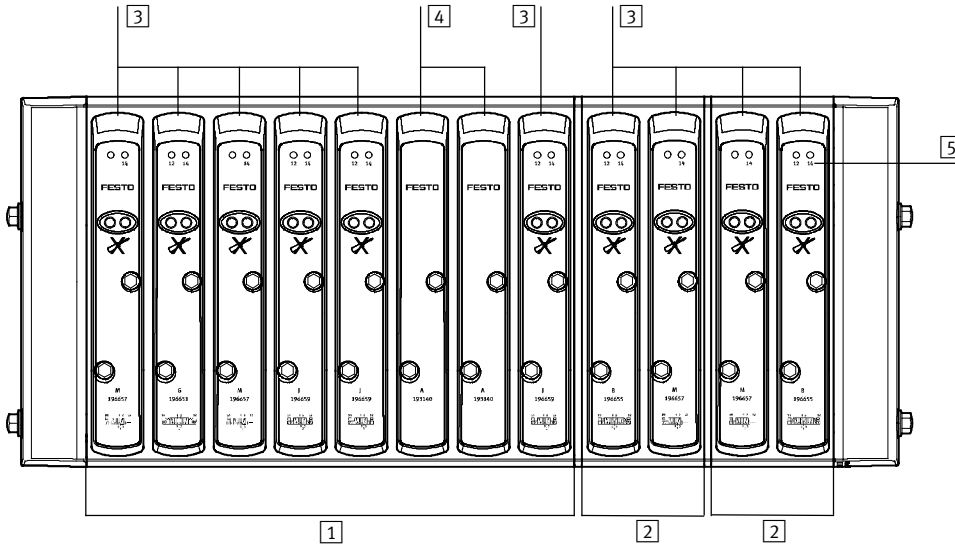

1	Basic block with 8 valve positions: 16 addresses
2	Extension module for 2 valve positions: 4 addresses => 24 addresses (coils)
3	Valves
4	Vacant positions
5	Number of the solenoid coil

Addressing order for valves with fieldbus

The CDVI valve terminal occupies 8, 16 or, depending on the extension, up to 24 addresses, regardless of the number of solenoid coils.
A 4-valve basic block occupies 8 addresses and an 8-valve basic block 16 addresses, while the 1-valve and 2-valve extension modules occupy 2 and 4 addresses respectively.

If a valve position is equipped with a valve with 2 pilot solenoid coils, the following allocation applies:
• Pilot solenoid coil 14 occupies the less significant address
• Pilot solenoid coil 12 occupies the more significant address

The more significant address is not used in valves with only one pilot solenoid coil.

The addresses of the CDVI valve terminal are allocated from left to right, while the addresses of the individual valve positions are allocated from right (pilot solenoid coil 14) to left (pilot solenoid coil 12).

- ☼ - Note

If the extension module is additionally configured with the option T (only one solenoid coil per valve position), only one address is occupied per valve position.

Example: Addressing order for a basic block with 4 valve positions and two extension modules for 2 valve positions
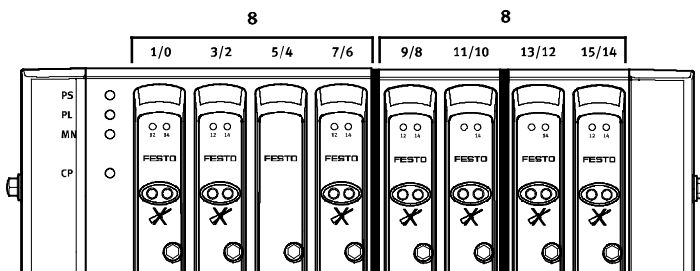

- ☼ - Note

Address shifts can occur if one expansion block is replaced by another type of expansion block. For example, replacing a 2-valve bi expansion block with a 2-valve mono expansion block shifts the address allocation to the right by 2 addresses.
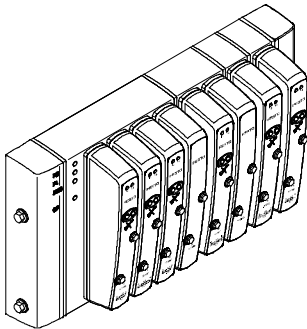

Fieldbus Direct is a system for the compact connection of a valve terminal of various sizes to different fieldbus standards.

The CP string extension option allows the functions and components of the CPI installation system to be used.

The I/O modules and cables for the CP string extension are ordered using the order code for the CPI installation system.

Additional information
➔ Internet: ctec

Enhanced fieldbus diagnostics

Enhanced diagnostics (supplied load voltage) is only possible with new basic blocks and new expansion blocks with additional electrical power supply (code C and V).

These new blocks can be identified by the 16-pin terminal strip (old = 12-pin) as well as the designation printed on the PCB. The green "Power Loss" LED on

the basic block flashes in the case of undervoltage/voltage failure of the additional power supply at the extension module (code C and V).

- ▮ -   Note

Enhanced diagnostics is not possible with combinations of old and new expansion blocks.

Electrical voltage zones
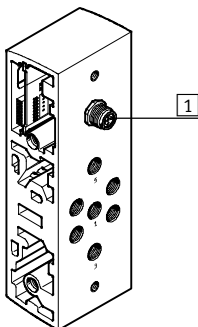

Up to 9 electrical voltage zones can be created with the help of extension modules with separate electrical power supply (code V and C), taking into consideration the maximum valve positions and number of coils.

By using an extension module with separate electrical power supply, the solenoid coils following to the right including the coils of the extension module are supplied separately with electrical power or disconnected separately.

1   Connection of separate electrical power supply

Valve terminals CDVI, Clean Design

Configuration and ident. code

Valve terminal configurator

A valve terminal configurator is available online to help you select a suitable CDVI valve terminal.

Like all valve terminals, the CDVI is ordered using an ident. code. This ident. code specifies the valve functions, the number of valves, vacant positions as well as the additional functions and the type of compressed air supply.

As is the case with all Festo products, all CDVI and CDSV are supplied:
• fully pre-assembled
• fitted with QS...-F fittings on the working lines and end plates on request
• tested for electrical function
• tested for pneumatic function

• securely packaged
• manuals can be downloaded free of charge

Ordering system for CDVI

Example of an ident. code

| 15P | – | K10 | – | 4A | – | UR | – | 3MJ-B-JG | – | E | + | Y |

Valve terminal family	
15P	CDVI

Electrical connection	
K10	Multi-pin plug, cable 10 m

Valve positions/type of connection	
4	Valves on basic block
A	Straight push-in fittings, QS-8

Pneumatic supply/type of seal	
U	Supply at left, internal pilot air supply
R	Resistant to cleaning agents

Selected valve equipment...	
	...basic block (position 0 ... 3)
3M	5/2-way single solenoid valve
J	5/2-way double solenoid valve
	...additional valves (position 4 and 5)
B	Extension module for 2 valve positions
J	5/2-way double solenoid valve
G	5/3-way valve, mid-position closed

Manual	
E	Manual in English

Type of mounting	
Y	Spacer bolt, length 1

Equipment

Operate system equipment with unlubricated compressed air if possible. Festo valves and cylinders are designed so that, if used as designated, they will not require additional lubrication and will still achieve a long service life.

The quality of compressed air downstream from the compressor must correspond to that of unlubricated compressed air. If possible, do not operate all of your system equipment with lubricated compressed air. The lubricators should, where possible, always be installed directly upstream of the consuming actuator.

Incorrect additional oil and too high an oil content in the compressed air reduces the service life of a valve terminal.

Use Festo special oil OFSW-32 or the alternatives listed in the Festo catalogue (as specified in DIN 51524 HLP32; basic oil viscosity 32 CST at 40 °C).

Bio-oils

When using bio-oils (oils which are based on synthetic or native ester, e.g. rapeseed oil methyl ester), the maximum residual oil content of 0.1 mg/m^3 must not be exceeded (see ISO 8573-1 Class 2).

Mineral oils

When using mineral oils (e.g. HLP oils to DIN 51524, parts 1 through 3) or similar oils based on poly-alpha-olefins (PAO), the maximum residual oil content of 5 mg/m^3 must not be exceeded (see ISO 8573-1 Class 4). A higher residual oil content irrespective of the compressor oil cannot be permitted, as the basic lubricant would be flushed out over time.
