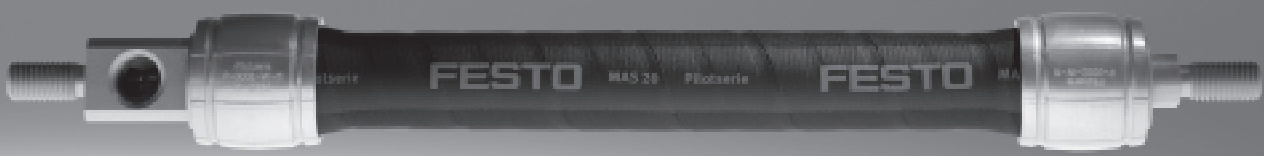
Fluidic Muscle DMSP/MAS



Fluidic Muscle DMSP/MAS

Key features

FESTO

At a glance

High initial force and acceleration

- Initial force up to 10 times higher than a conventional cylinder of the same diameter
- Highly dynamic response, even at high loads

Judder-free operation

- No mechanical parts moving against one another
- Completely jolt-free with extremely slow movements

Simple positioning

- Controlled by means of pressure using the simplest technology without displacement encoders

Hermetically sealed design

- Separation between operating medium and atmosphere
- Ideal for dusty and dirty environments
- Robust design
- Zero leakage

Mode of operation

Fluidic Muscle is a tensile actuator which mimics natural muscular movement. It consists of a contraction system and appropriate connectors. The contraction system is formed by a pressure-tight length of rubber hose, sheathed in high-strength fibres. The fibres create a rhomboidal pattern with a three-dimensional grid structure. When internal pressure is applied, the hose expands in its peripheral direction, thus creating a tensile force and a contraction motion in the muscle's longitudinal direction. The usable tensile force is at its maximum at the start of the contraction and then decreases in a virtually linear manner as a function of stroke. An efficient operating range is provided with contractions of up to 15% of the nominal length.

The applications of Fluidic Muscle are as follows:

– Single-acting actuator
– Pneumatic spring

Note

Fluidic Muscle is intended for use as a tensile actuator only. The expansion in the peripheral direction cannot be used for clamping purposes, since external friction could cause damage to the muscle.

Fluidic Muscle DMSP, with press-fitted connections

→ 8

The Fluidic Muscle DMSP with press-fitted connections is the result of a thorough analysis of the requirements specification that already existed for the Fluidic Muscle MAS. The resulting new development is therefore considerably lighter, more compact and durable.

- More compact design with more muscle, achieved thanks to a 25% more compact cross section.
- Up to 30% less weight, which translates into a superb force/weight ratio.
- Choice of three integrated adapter variants.

Fluidic Muscle MAS, with screwed connections

→ 18

The Fluidic Muscle MAS is characterised by a long service life that is made possible through the use of optimised materials. The Fluidic Muscle MAS is also available with an adapter and force-safety device.

- The force-safety device makes it possible to limit the lifting force, which can for instance protect against trapping objects.
- Use of customer-specific adaptation options.

Sizing the muscle

Sizing software

Sizing should be carried out using the MuscleSIM software.
This software can be downloaded from ➔www.festo.com.

Graphical sizing

Apart from sizing the muscle using the software, it is also possible to define the length of the muscle with the aid of force/displacement diagrams.

Graphical sizing of the muscle is explained with the aid of two examples ➔ 32.

Force curve and load cases

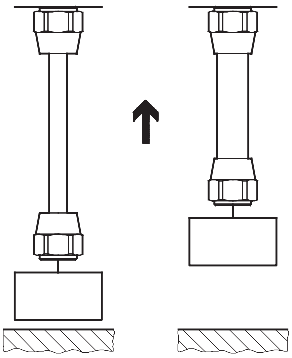
The nominal length of the pneumatic muscle is defined in the non-pressurised, load-free state. It corresponds to the visible muscle length between the connections. The muscle extends when it is pretensioned by an external force. When pressurized, on the other hand, the muscle contracts, i.e. its length decreases.

Single-acting actuator

Sizing examples ➔ 32

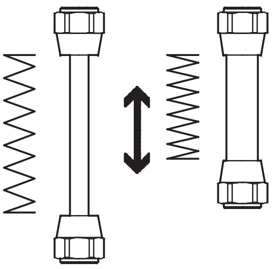
In the simplest case, Fluidic Muscle operates as a single-acting actuator against a constant load. Assuming that this load is permanently attached to the muscle, it will project from its initial position when in the extended non-pressurised state. This operating status is ideal with regard to the technical properties of Fluidic Muscle: when pressurised, a Fluidic Muscle pretensioned in this way develops maximum force with optimum dynamic characteristics and minimum air consumption. The usable force is also at a maximum in this case. If a Fluidic Muscle is required to be free of forces in the extended state, for example to allow a load to be attached, a holding force must first be developed for lifting purposes, leaving a small force component for the motion itself.

Load = Constant



Fluidic Muscle behaves like a spring with a changing external force: it follows the direction of action of the force. With Fluidic Muscle, both the pretensioning force of this “pneumatic spring” and its spring stiffness can be varied. Fluidic Muscle can be operated as a spring with constant pressure or constant volume. These produce different spring characteristics that enable the spring effect to be matched perfectly to a given application.

Pressure/volume = Constant



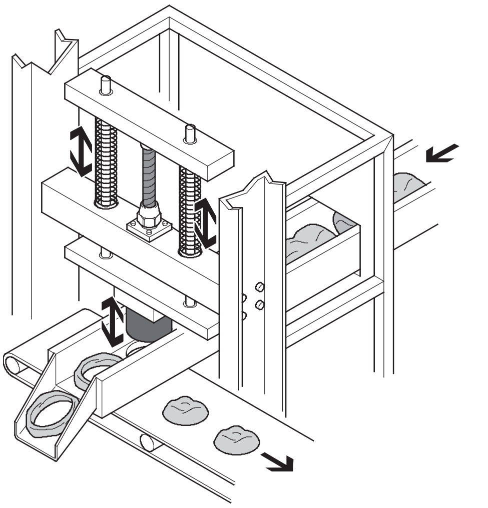
Note

If the muscle is fed with compressed air and the volume blocked, the pressure in the muscle can increase significantly when the external force is varied. The service life of the Fluidic Muscle depends on the contraction, the operating pressure and the temperature ➔34.

High operating frequencies or high loads can lead to a temperature rise.

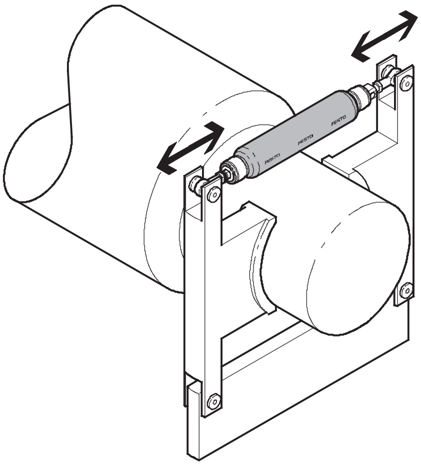
Force and dynamism

Drive for tab punching



Very high cycle rates are possible with the muscle, on the one hand because of its low weight and on the other because it has no moving parts (e.g. piston). The simple construction – one muscle pretensioned using two springs – replaces a complicated toggle lever clamping system using cylinders. This makes a frequency increase of 3 to 5 Hz possible. Over 50 million load fluctuations can be achieved in this way.

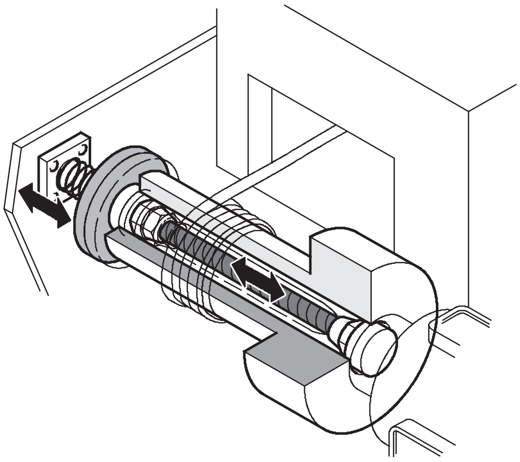
Emergency stop for rollers



The fluidic muscle is setting new standards in applications that require fast response times. The emergency stop for rollers demands both speed and force. Long machine downtimes in the event of malfunctions can thus be prevented.

Judder-free movements

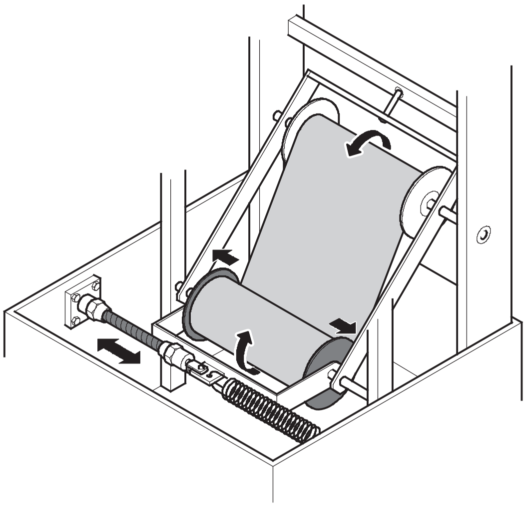
Brake actuator for rewinding equipment



The friction-free muscle allows uniform and gentle braking of the pay-out reel, ensuring highly precise winding at constant speed. Control is provided by a proportional control valve whose signals are regulated via force sensors.

Judder-free movements

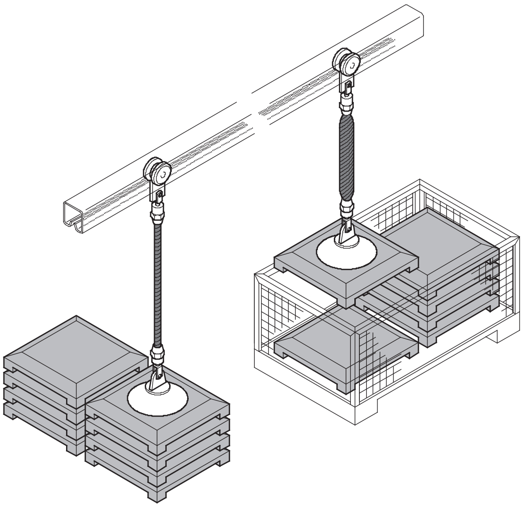
Belt edge control for winding processes



The aim:
uniform winding of paper, foil or textiles.
The requirement:
a friction-free drive with quick and immediate response characteristics.
The solution:
Fluidic Muscle. The drum attached to a moving frame is displaced by a pneumatic muscle as soon as the sensor detects misalignment. This means that the winding edge control is 100% efficient.

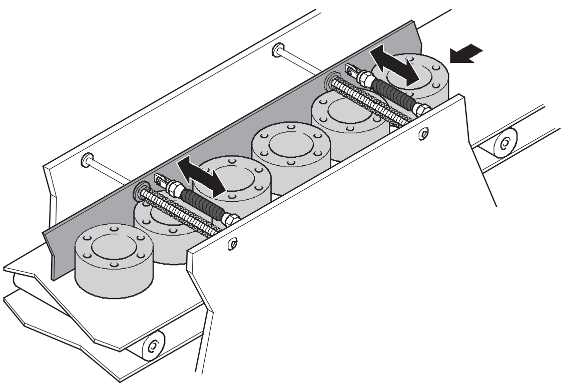
Simple positioning systems

Simple lifting device for manipulating concrete slabs and car wheel rims



Approximate intermediate positions? No problem with pressure regulation. The workpieces can be raised or lowered as required by pressurising or exhausting the muscle via a hand lever valve. Muscle lengths up to 9 m facilitate various types of application.

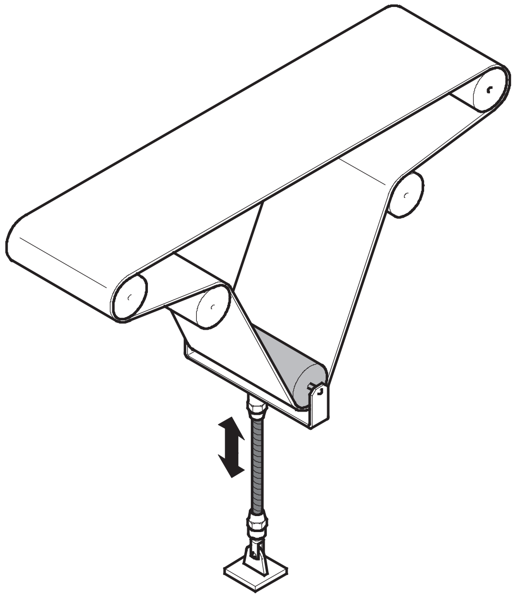
Adjusting the width of conveyor belts



With small batch sizes, it is often necessary to adapt entire system sections to different component dimensions after a short period of time. This task can be performed with the fluidic muscle in cases where an approximate adjustment is sufficient.

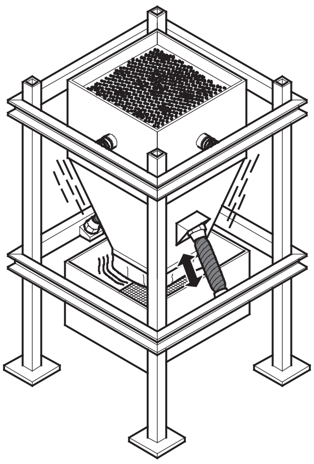
Harsh environmental conditions

Belt tensioner for conveyed goods



In dusty or dirty environments, a hermetically sealed fluidic muscle has a major advantage over conventional drives. This seal cannot wear. It is a sturdy, contractible tube that copes with the tough demands of the cement industry with ease.

Drive for a vibratory hopper



Hoppers and silos are susceptible to the problem of parts jamming during feeding. Fluidic Muscle facilitates stepless regulation of a pneumatic shaker between 10 and 90 Hz, thereby guaranteeing continuous delivery.

Permissible force F [N] as a function of the contraction h [%] of the nominal length

Force/displacement diagrams and sizing ranges

The limit for "freely suspended" loads is derived from the contraction. With the Fluidic Muscle DMSP-10-..., a loosely attached additional load of 30 kg results in 3% pretensioning (see diagram).The limits specified in the technical data must be complied with when using the fluidic muscle. The diagrams below illustrate the operating range of the fluidic muscle, depending on the diameter, within the boundary lines illustrated below.

Using the diagrams

1. The upper limit of the grey area describes maximum permissible force.
2. The right limiting curve of the grey area describes the maximum permissible operating pressure.
3. The right vertical limit of the grey area describes the maximum permissible contraction.
4. The left limit of the grey area describes the load limit of the muscle defined by the maximum pretensioning.

Note

The diagrams were determined using muscles with standard length (standard length = 10x internal dia.), sizing should therefore be carried out using the Fluidic Muscle sizing software. The software is available at the address → www.festo.com. Approximate sizing is possible using the force/displacement diagram. Properties that influence the dependence between force and displacement, such as material properties, manufacturing deviations and nominal length, are not taken into account in these diagrams. The theoretical force can therefore increase by up to ten per cent. Deviations can be compensated by means of pressure adaptation up to the maximum permissible operating pressure.

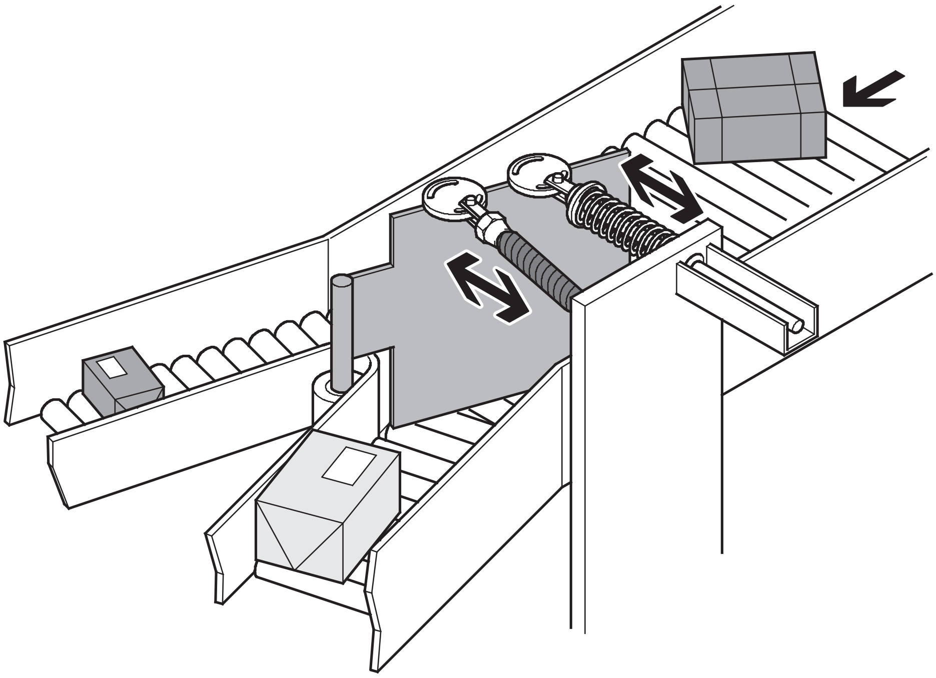
Force and dynamism

Drive for sorting

The ideal drive for sorting tasks and stop functions in delivery processes thanks to the muscle's high speed and good acceleration behaviour. The short response times mean that cycle rates can be increased considerably.



Axial adapter MXAD-A
(order code EA/BA/RA)

Material:
Adapter: Anodised aluminium
Nut: Brass
Seal: Nitrile rubber

1) Threaded rod MXAD-T... is required.

Example 1

Lifting a constant load

A Fluidic Muscle is to be used to engage free of forces with a constant load of 80 kg on a supporting surface and raise this a distance of 100 mm. The operating pressure is to be 6 bar.

The size (diameter and nominal length) of the fluidic muscle is to be found.

Note

The sizing should be performed using the Fluidic Muscle sizing software, as the diagrams describe only a muscle of standard length (standard length = 10x internal dia.). The software is available at the address ➔ www.festo.com.

The limits specified in the technical data must be complied with when using the muscle.

General conditions	Values
Required force at rest	0 N
Required stroke	100 mm
Required force in contracted state	approx. 800 N
Operating pressure	6 bar

Solution method

Step 1
Determining the required muscle size

Determine the most suitable muscle diameter on the basis of the required force. The required force is 800 N.

MAS-20-… or MAS-40-… are available for selection.

Step 2
Entering load point 1

Load point 1 is entered into the force/displacement diagram for the MAS-20-…

Force F = 0 N
Pressure p = 0 bar

Step 3
Entering load point 2

Load point 2 is entered into the force/displacement graph.

Force F = 800 N
Pressure p = 6 bar

Step 4
Reading the length change

The change in the length of the muscle is read between the load points on the X axis (contraction in %).

Result:
9.6% contraction.

Step 5
Calculating the nominal length

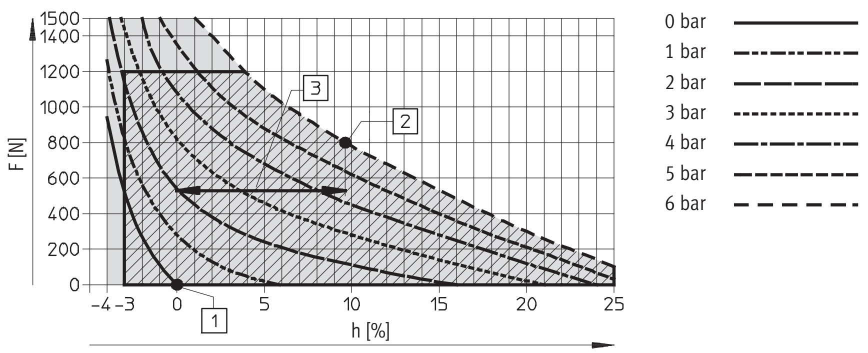
The required nominal muscle length for a stroke of 100 mm is obtained by dividing by the contraction in %.

Result:
100 mm / 9.6% ~ 1042 mm.

Step 6
Result

A Fluidic Muscle with a nominal length of 1042 mm should be ordered.

In order to attach a load of 80 kg free of forces and lift this 100 mm, a MAS-20-1042N-AA-… is required.



1 Load point 1
2 Load point 2
3 Length change = 9.6%

Example 2

Use as a tension spring

In this example, the muscle is to be used as a tension spring.

The size (diameter and nominal length) of the fluidic muscle is to be found.

Note

Sizing should be performed using the Fluidic Muscle sizing software, as the diagrams describe only a muscle of standard length (standard length = 10x internal dia.). The software is available at the address → www.festo.com.

The limits specified in the technical data must be complied with when using the muscle.

General conditions	Values
Required force in extended state	2000 N
Required force in contracted state	1000 N
Required stroke (spring length)	50 mm
Operating pressure	2 bar

Solution method

Step 1
Determining the required muscle size

Determine the most suitable muscle diameter on the basis of the required force. The required force is 2000 N, therefore an MAS-40-... is selected.

Step 2
Entering load point 1

Load point 1 is entered into the force/displacement diagram for the MAS-40-...

Force F = 2000 N
Pressure p = 2 bar

Step 3
Entering load point 2

Load point 2 is entered into the force/displacement graph.

Force F = 1000 N
Pressure p = 2 bar

Step 4
Reading the length change

The change in the length of the muscle is read between the load points on the X axis (contraction in %).

Result:
8.7% contraction.

Step 5
Calculating the nominal length

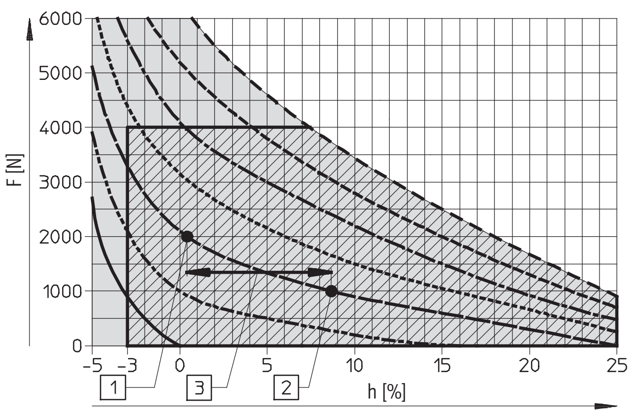
The required nominal muscle length for a stroke of 50 mm is obtained by dividing by the contraction in %.

Result:
50 mm / 8.7% ~ 544 mm.

Step 6
Result

A Fluidic Muscle with a nominal length of 544 mm should be ordered.

For use as a tension spring with a force of 2000 N and a spring travel of 50 mm, a ... is required.

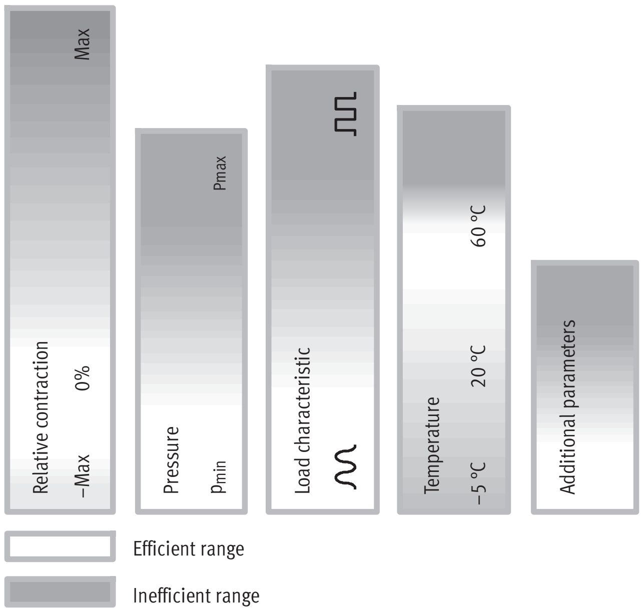


- 0 bar
- 1 bar
- 2 bar
- 3 bar
- 4 bar
- 5 bar
- 6 bar

1. Load point 1
2. Load point 2
3. Length change = 8.7%

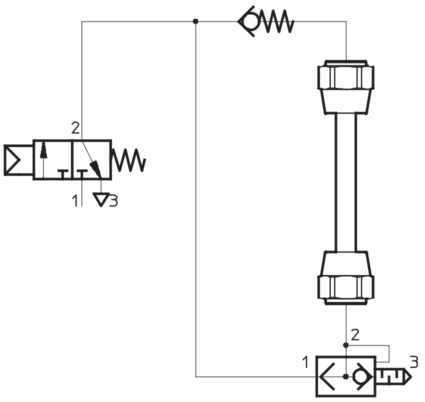
Service life (bar height = meaning / influence)

Optimisation through selection of suitable parameters



The service life of the fluidic muscle is between 100000 and 10 million switching cycles for typical applications. Optimisations can be made using the information from the left diagram. The service life thus increases due to a reduction in the relative contraction (use of a longer muscle). It is also recommended that the pressure be reduced, which is possible because the fluidic muscle is more powerful with lower relative contraction. This measure also improves the service life.

Reducing the thermal load



The service life of the Fluidic Muscle depends on the contraction, the operating pressure and the temperature. High operating frequencies or high loads can lead to a temperature rise. Targeted pressurisation on one side and venting on the other side enables. the thermal load on the component to be reduced and the service life of the fluidic muscle to be increased (only with fluidic muscle open at both ends).

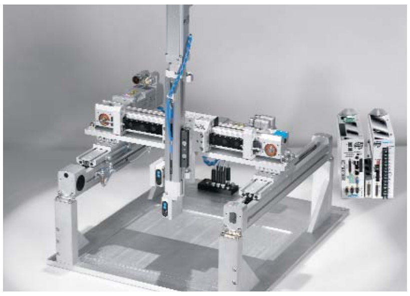
Product Range and Company Overview

A Complete Suite of Automation Services

Our experienced engineers provide complete support at every stage of your development process, including: conceptualization, analysis, engineering, design, assembly, documentation, validation, and production.

Custom Automation Components
Complete custom engineered solutions

Custom Control Cabinets
Comprehensive engineering support and on-site services



Complete Systems
Shipment, stocking and storage services

The Broadest Range of Automation Components

With a comprehensive line of more than 30,000 automation components, Festo is capable of solving the most complex automation requirements.

Electromechanical
Electromechanical actuators, motors, controllers & drives

Pneumatics
Pneumatic linear and rotary actuators, valves, and air supply

PLCs and I/O Devices
PLC's, operator interfaces, sensors and I/O devices

Supporting Advanced Automation... As No One Else Can!
Festo is a leading global manufacturer of pneumatic and electromechanical systems, components and controls for industrial automation, with more than 12,000 employees in 56 national headquarters serving more than 180 countries. For more than 80 years, Festo has continuously elevated the state of manufacturing with innovations and optimized motion control solutions that deliver higher performing, more profitable automated manufacturing and processing equipment. Our dedication to the advancement of automation extends beyond technology to the education and development of current and future automation and robotics designers with simulation tools, teaching programs, and on-site services.

Quality Assurance, ISO 9001 and ISO 14001 Certifications

Festo Corporation is committed to supply all Festo products and services that will meet or exceed our customers' requirements in product quality, delivery, customer service and satisfaction.

To meet this commitment, we strive to ensure a consistent, integrated, and systematic approach to management that will meet or exceed the requirements of the ISO 9001 standard for Quality Management and the ISO 14001 standard for Environmental Management.

ISO 9001
ISO 14001
