

Rotary indexing tables DHTG

FESTO

Rotary indexing tables DHTG

Key features

At a glance

- Sturdy mechanical system
- Easy planning and commissioning
- Indexing: 2, 3, 4, 6, 8, 12, 24
- Integrated functions:
 - Overload protection
 - Sensor function
 - Cushioning adjustment
- Speed setting
- Changing the direction of rotation

Control options

Clockwise

- Just one valve required

Anticlockwise

- Just one valve required

Reciprocating motion

- After conversion with a reciprocating motion kit
- Two valves required

Flexible control: Clockwise, anticlockwise, reciprocating motion

- After conversion with a reciprocating motion kit
- Two valves required

The technology in detail

- Through-hole for energy throughfeed
- Thread for position sensing
- One-way flow control valve for regulating speed
- Supply port for reciprocating motion
- Supply port for clockwise or anticlockwise rotation
- Adjusting screw for cushioning adjustment

Overload protection

To prevent the rotary indexing table from being damaged by an excessive mass moment of inertia, e.g. during setting operation or in the event of shock absorber failure, sizes 140 and 220 feature overload protection. If the mass moment of inertia is too large, the securing pin is pressed against the spring force by the result-

ing radial force. It then slides forward on the toothed segment. This shift in position between the index plate and toothed segment means that the securing pin can no longer engage and the rotary indexing table does not move. The table can be made ready for use again by turning it back.

- Securing pin
- Spring
- Toothed segment

Energy throughfeed

Electrical signals or compressed air can be transferred through the hollow shaft using the energy throughfeed. This enables fast and easy supply of the parts connected to the rotary table.

- Electrical connection (output)
- Housing, energy throughfeed
- Supply port (output)
- Rotary indexing table
- Supply port (input)
- Electrical connection (input)

Rotary indexing tables DHTG

Key features

Mounting options

Direct mounting from above

Direct mounting from below

Application examples

Basic rotary table

- Handling with minimum space requirement

Rotary table with rotary distributor

- For the transfer of compressed air and vacuum to the rotary table
- With 1 or 2 separate ducts

Rotary table with stationary centre section

- For the mounting of handling units or other devices in the centre of the rotary indexing table

 **Note**

The rotary indexing tables are not designed for the following or similar sample applications:

- Machining
- Aggressive media

- Grinding dust

- Welding spatter

Peripherals overview

Variants and accessories			
Type	Description		→ Page/Internet
1 Plate, fixed	For illustration purposes only, not included in the scope of delivery		26
2 Adapter kit DADG-AK	For mounting a blank plate on the rotary indexing table		26
3 Plate, rotary	For illustration purposes only, not included in the scope of delivery		26
4 Indexing conversion kit DADM-CK	The step angles can be adjusted at any time using the kit		28
5 Reciprocating motion kit DADM-TK	Allows conversion from movement in one direction to reciprocating motion		28
6 Proximity sensor SIEN	For sensing the switching position of the rotary indexing table		28
7 Rotary distributor GF	Distributes the compressed air fed through the centre of the rotary indexing table to the actuators on the rotating blank plate. Cannot be used in combination with a fixed blank plate		27
8 Adapter kit DADG-AK-...-...G...	For mounting the rotary distributor on the rotary indexing table		27
9 Pneumatic/electric energy throughfeed	For quick and easy pneumatic/electrical supply of parts connected to the rotary plate		10
10 Rotary indexing table DHTG	Flexible application range: anticlockwise rotation, clockwise rotation or reciprocating motion		6
11 Connecting cables NEBU, NEBS	For transmitting the signals		29

General technical data					
Size		65	90	140	220
Pneumatic connection		M5		G1/8	
Design		Gear coupling			
		Rack and pinion			
		Force pilot operated motion sequence			
Mode of operation		Double-acting			
Type of mounting		Via through-hole and centring sleeve			
Mounting position		Any			
Cushioning		Adjustable shock absorber stroke, hard characteristic curve			
Indexing		2, 3, 4, 6, 8, 12, 24		3, 4, 6, 8, 12, 24	
Torque at 6 bar	[Nm]	2.1	4.4	18.1	58.9
Parallelism of plate ¹⁾	[mm]	≤ 0.04			
Axial eccentricity of plate ²⁾	[mm]	≤ 0.02			
Concentricity of plate ³⁾	[mm]	≤ 0.02			
Repetition accuracy of swivel angle	[°]	≤ 0.03			
Max. mass moment of inertia without flow control ⁴⁾	[kgm ²]	0.016	0.03	0.3	2.5
Cycle time without flow control		→ 8			
Position sensing		Via inductive proximity sensors			
Weight					
DHTG-...	[kg]	2.0	4.5	10	24
DHTG-...-P4	[kg]	4.39	6.89	12.49	26.64
DHTG-...-P4E4	[kg]	5.12	7.62	13.22	27.37
DHTG-...-P4L12	[kg]	5.15	7.65	13.25	27.40

1) Parallelism of plate surface to housing support

2) Measured on the surface of the plate at the edge of the plate in relation to the housing support

3) Measured on the inner diameter of the plate in relation to the housing

4) Operation with flow control can increase the mass moment of inertia by 50%. The service life of the shock absorber is reduced in this case. The mass moment of inertia depends on the number of stations and the switching frequency (→ 9)

Note

The "clockwise" rotation of the table can be controlled via an internal flow control valve in combination with the reciprocating motion kit. For "anti-

clockwise" rotation, external actuation via an additional one-way flow control valve GRLA is needed.

Operating and environmental conditions	
Operating medium	Compressed air in accordance with ISO 8573-1:2010 [7:4:4]
Note on operating/pilot medium	Lubricated operation possible (in which case lubricated operation will always be required)
Operating pressure [bar]	4 ... 8
Ambient temperature [°C]	5 ... 60
Storage temperature [°C]	-20 ... +80
Degree of protection	IP54 ²⁾
Corrosion resistance class CRC ¹⁾	2

1) Corrosion resistance class CRC 2 to Festo standard FN 940070

Moderate corrosion stress. Indoor applications in which condensation may occur. External visible parts with primarily decorative requirements for the surface and which are in direct contact with the ambient atmosphere typical for industrial applications.

2) The specified degree of protection applies to the top side of the rotary indexing table. The underside must be provided with appropriate external protection for the environment.

Rotary indexing tables DHTG

Calculation of the cycle time

The rotary indexing tables are equipped with a hydraulic shock absorber, which means that the max. frequency of the shock absorber must also be taken into account when calculating the cycle time.

The switching time comprises:
Switching time = Unlock, rotate, lock and return stroke of working piston.
The cycle time is calculated as follows:
Cycle time = Switching time + Processing time + Dwell time.

In the switching frequency graph, the max. achievable switching frequency is read in relation to the mass moment of inertia. The switching time can be calculated from this as follows:
 $T = 60/f$. The processing time is calculated from the time required by

the respective customer application (e.g. time for component removal, press-in time, etc.). A dwell time may be necessary if the cycle time is shorter than the min. possible cycle time.

Calculation example

DHTG-140 with 8 indexing stations and a mass moment of inertia of 0.1 kgm².

The customer application requires 300 ms per step for the insertion and removal of parts.

Switching frequency

$$T_{\text{Switchingtime}} = \frac{1}{f} = \frac{60s}{130} = 0.461s = 461ms$$

Max. permissible cycle frequency

$$T_{\text{Min.permissiblecycletime}} = \frac{60s}{59} = 1.017s = 1017ms$$

Dwell time = Min. permissible cycle time – Switching time – Processing time

Dwell time = 1017 ms – 461 ms – 300 ms = 256 ms.

Given the fact that the switching time + processing time is shorter than the min. permissible cycle time, the rotary indexing table must stay in the end position

before the next step is performed. In other words, between the circuits an additional dwell time of 256 ms must be allowed for in the control sequence.

Accessories

Wiring of the proximity sensor in combination with the energy throughfeed

Sample illustration using DHTG-...-P4E4

Note

For variant DHTG-...-P4E4, proximity sensors with plugs must be used for the attachments at the output. These are then connected to the energy throughfeed module using a Y-distributor.
