Parallel kinematic system EXPT, tripod

Key features

At a glance

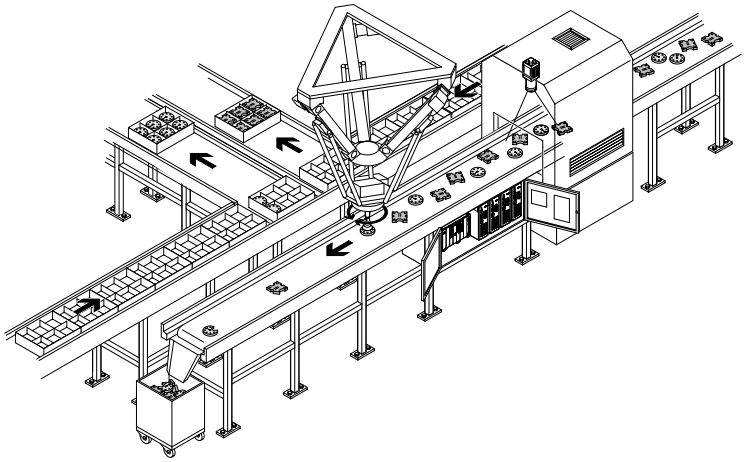
The high-speed handling unit with robot functionality for free movement in three dimensions provides precision in movement and positioning as well as a high dynamic response of up to 150 picks/min.
The highly rigid mechanical design and low moving mass make the parallel kinematic system with toothed belt axes up to three times as fast as comparable Cartesian systems.
Three double rods keep the front unit horizontal at all times. The axes and servo motors do not move with the unit.
The parallel kinematic system is suitable for handling loads of up to max. 5 kg.

Typical applications include:
- Picking & placing small parts
- Gluing
- Labelling
- Palletising
- Sorting
- Grouping
- Repositioning and separating

Comparison between parallel kinematic and Cartesian systems

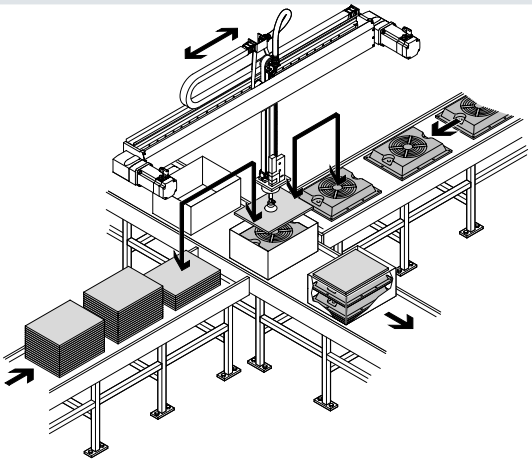
Parallel kinematic system

- Low moving mass – ideal for demanding requirements on dynamic response in three dimensions
- High path accuracy with a range of path profiles, even for highly dynamic operation
- Four sizes with a working space diameter of up to 1200 mm



Cartesian system

- Axes build on one another; the first axis carries all the subsequent axes
- High moving mass, therefore much lower dynamic response
- Rectangular, scalable working space
- Based on standard components
- Flexible designs



Key features

The technology in detail

Parallel kinematic system

[10] Tubing holder ➔ page 26
[11] Front unit for mounting a gripper, etc. ➔ page 18

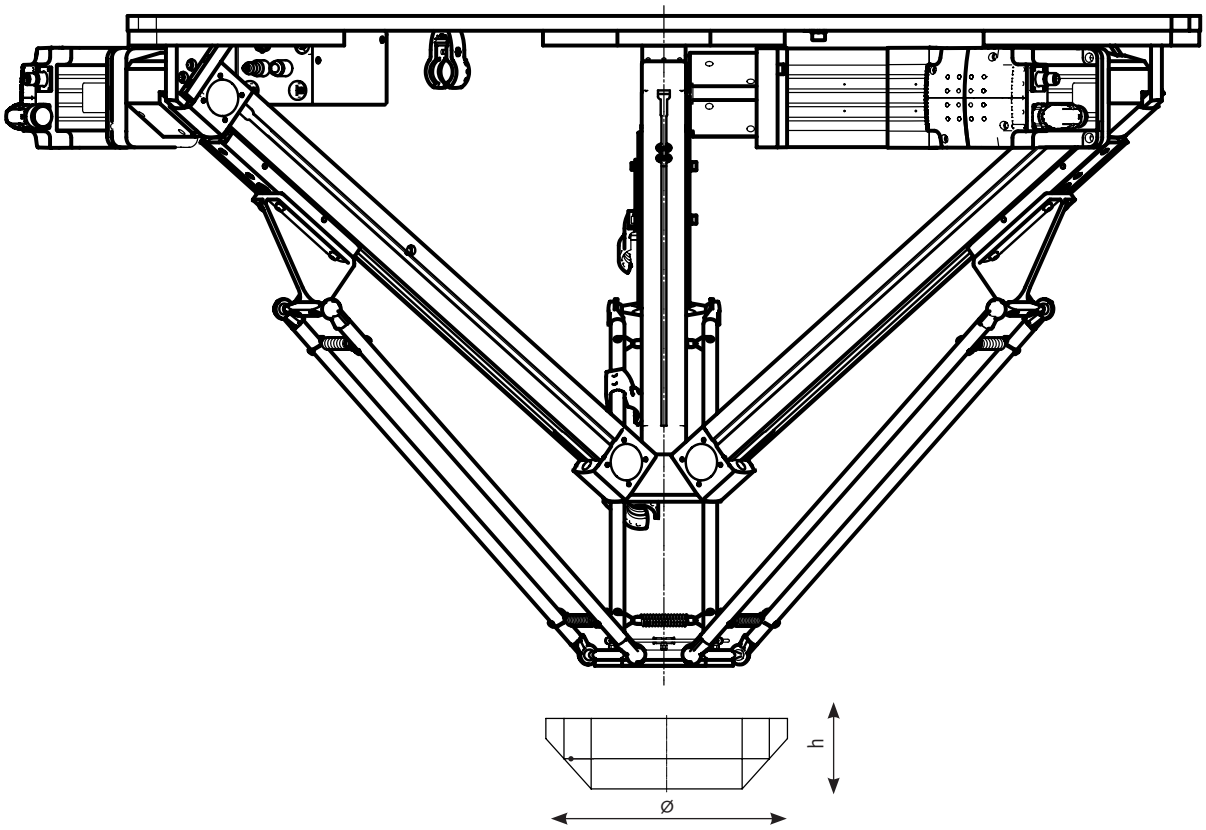
Front unit ➔ Page 18

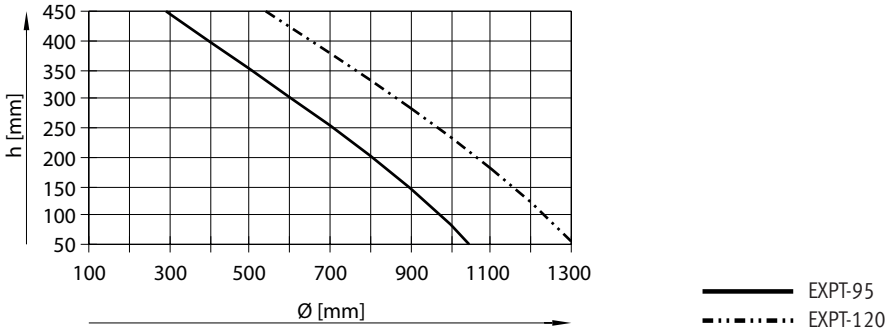
The front unit can optionally be ordered via the modular product system. It includes a gear motor that enables rotary movement (fourth axis) and is available in two sizes.
The front unit can also be chosen with or without rotary through-feed, for vacuum or excess pressure.
A range of grippers can be attached to it ➔ Page 27.

Key features

Available working space

There are four sizes available with different working space diameters.
The possible working space can more simply be described using the shape of a cylinder (➔ drawing).
The larger the working space required, the smaller its diameter (➔ graph).



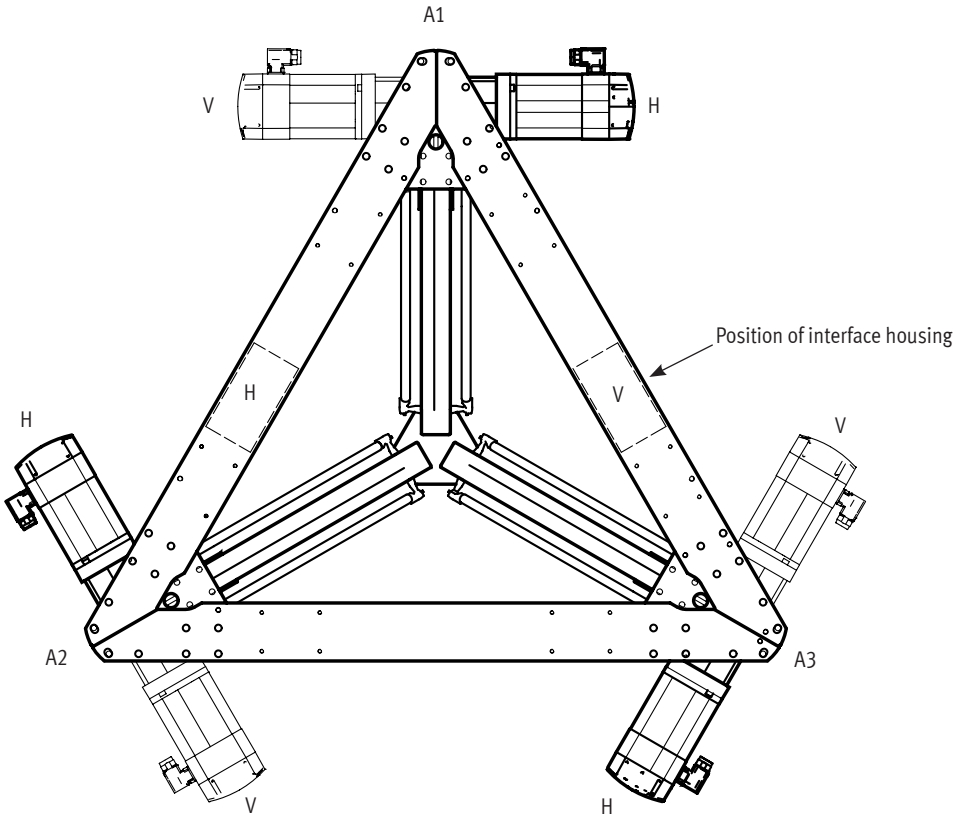


Key features

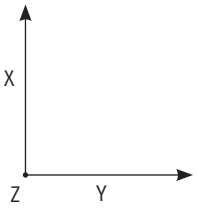
Motor mounting variants

The attachment position of the motors can be individually configured via the modular product system (→ page 24).
The standard motor attachment position corresponds to code HHH (cf. illustration below). This means: A1/A2/A3 rear.
If a motor is to be attached on the front, a 'V' must be specified in the order code for the respective axis.
The position of the interface housing depends on the position of the motor (V or H) on axis A1.

Code	Description
HHH	A1/A2/A3 rear
HHV	A3 front; A1/A2 rear
HVH	A2 front; A1/A3 rear
HVV	A2/A3 front; A1 rear
VHH	A1 front; A2/A3 rear
VHV	A1/A3 front; A2 rear
VVH	A1/A2 front; A3 rear
VVV	A1/A2/A3 front



Coordinate system



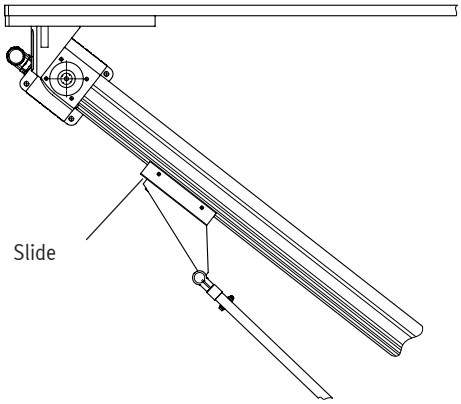
Key features

Protection against particles

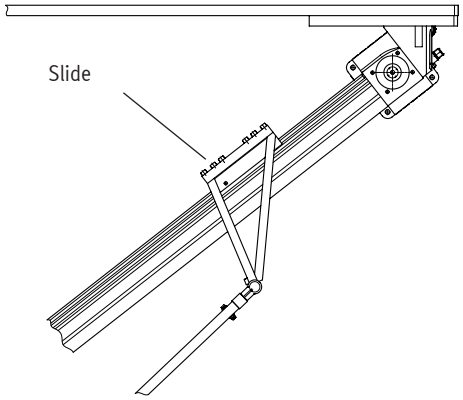
Installation type: protected version (P8)

Abrasion on the toothed belt can lead to loose particles falling into the working space in the basic design.
If the variant EXPT-...-P8 (➔ page 24) is selected, the axes are turned during installation (slide on top). A covering kit EASC-E10 (➔ page 26) can additionally be ordered as a separate accessory and fitted; this prevents these particles from entering the working space. They slide downwards into the troughs and collect in the cover (see below).

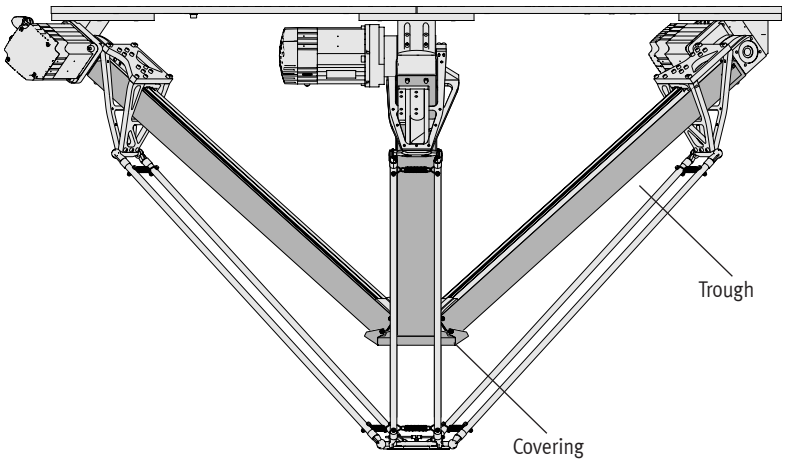
Standard



Protected version (P8)

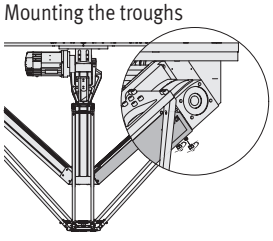


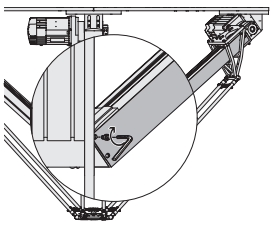
Protected version (feature P8 in the modular product system) with covering kit EASC-E10 (ordered separately as an accessory)



Easy mounting of the covering kit EASC-E10

Mounting the troughs





Fitting the covering

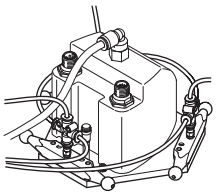
		Free of copper and PTFE

Rod loss detection

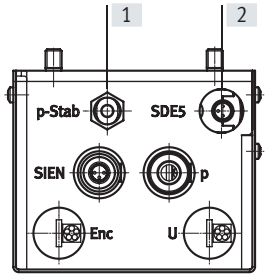


The rod loss detection feature detects detached rods and initiates an emergency stop.

This is realised using permanent compressed air monitoring (pressure switch integrated in the interface housing on the frame)

This is done by pressurising the ball cup connections of the front unit with compressed air at 2 bar (rel.).

Connections on the interface housing:



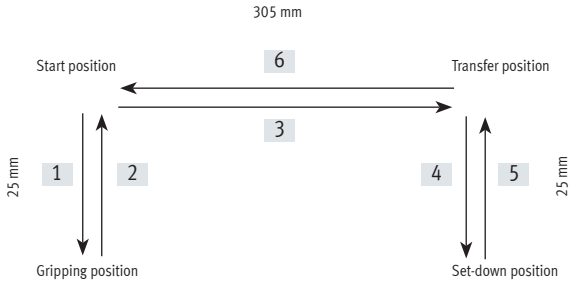
[1] Compressed air supply for rod loss detection.
The compressed air is adjusted to 2 bar in the interface housing.

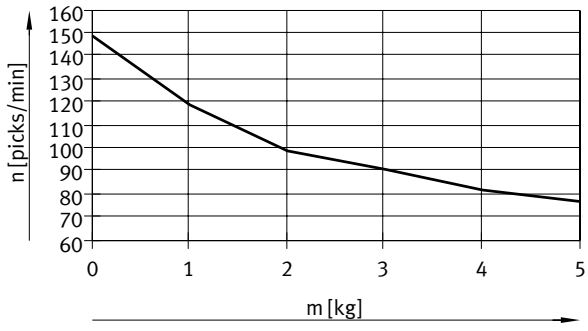
[2] Pressure sensor for monitoring rod loss detection.
Connecting cable
→ Page 24

Pick rate as a function of rated load

The characteristic values for dynamic response are determined in so-called 12" cycles. The graph below shows the maximum number of possible cycles as a function of rated load. It is based on an accuracy of ±0.5 mm.

One 12" cycle means:
[1] To the gripping position
[2] To the start position
[3] To the transfer position
[4] To the set-down position
[5] To the transfer position
[6] To the start position





n = cycles per minute
M = rated load

Datasheet

Requirements for the frame

The positioning and path accuracy depends to a large extent on the design of the frame.
The following influences must therefore be taken into consideration:
- Rigidity of frame
- Mass of frame
- Mass of the parallel kinematic system
- Start-up frequency caused by dynamic operation of the parallel kinematic system
  - Cycles per minute
  - Dynamic settings for acceleration and jerk

Maximum forces occur if two axes accelerate in the opposite direction to the third and result in horizontal movement of the rated load.
The frame must be designed so that the maximum forces that can occur can be absorbed with the necessary degree of certainty.

The guide value for the first natural frequency is specified to be at least 16 Hz for the complete system.

At the maximum dynamic response of the axes, the following forces act on the corner brackets of the mounting frame and thus on the fastening in the frame.

Size		95	120
Vertical force	[N]	±325	±475
Horizontal force	[N]	±200	±215

Mounting options on the frame

The parallel kinematic system must always be mounted in the corner brackets of the mounting frame. Ensure that the corner bracket area has a torsionally rigid, flat bearing surface.

The bearing surface must meet the following minimum requirements in order to achieve the positioning accuracy:
- Flatness = 0.05 mm
- Parallelism = 0.5 mm

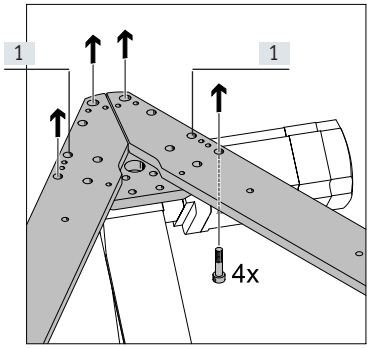
Since the distance between the slots is 40 mm in the 80x80 profile, the drilled holes in the corner brackets have been positioned so that the profile can be mounted in various positions.

Since the homing settings of the corresponding axis are lost when the motor is dismounted, it is recommended to use mounting holes that do not require the motor to be removed.
The drilled holes [1] are not accessible, depending on the attachment position of the motor.

Direct mounting via screws

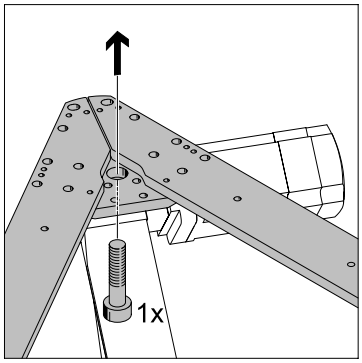
Screws M8x...

Via at least 4 screws (M8) per corner bracket directly on the frame. These 4 screws should be placed as far apart as possible to ensure a torsionally rigid connection.



Screws M20x...

Via 1 screw (M20) per corner bracket directly on the frame. There is a central drilled hole on each bracket for this purpose.



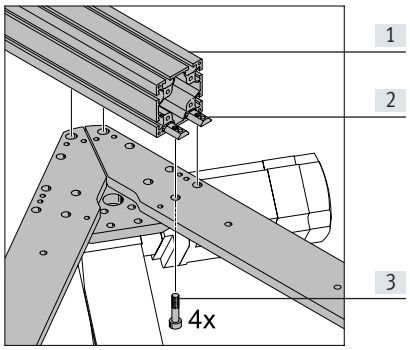
Datasheet

Mounting options on the frame

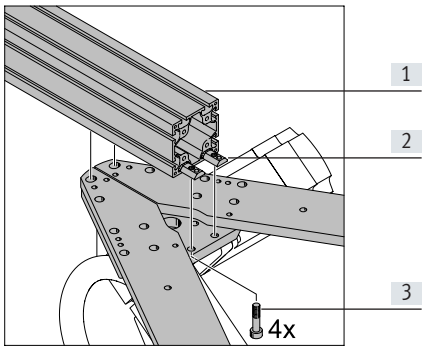
Mounting via slot nuts – parallel to the mounting frame

[1] Profile
(e.g. HMBS-8 0/80)
[2] Slot nut
(e.g. NST-HMV-8-2-M8)
[3] Screws
(e.g. M8x35)

Example 1



Example 2



Mounting via slot nuts – at right angles to the mounting frame

[1] Profile
(e.g. HMBS-8 0/80)
[2] Slot nut
(e.g. NST-HMV-8-2-M8)
[3] Screws
(e.g. M8x35)
[4] Bracket

The additional brackets in the following examples are required in order to increase the torsional rigidity and the bearing surface.

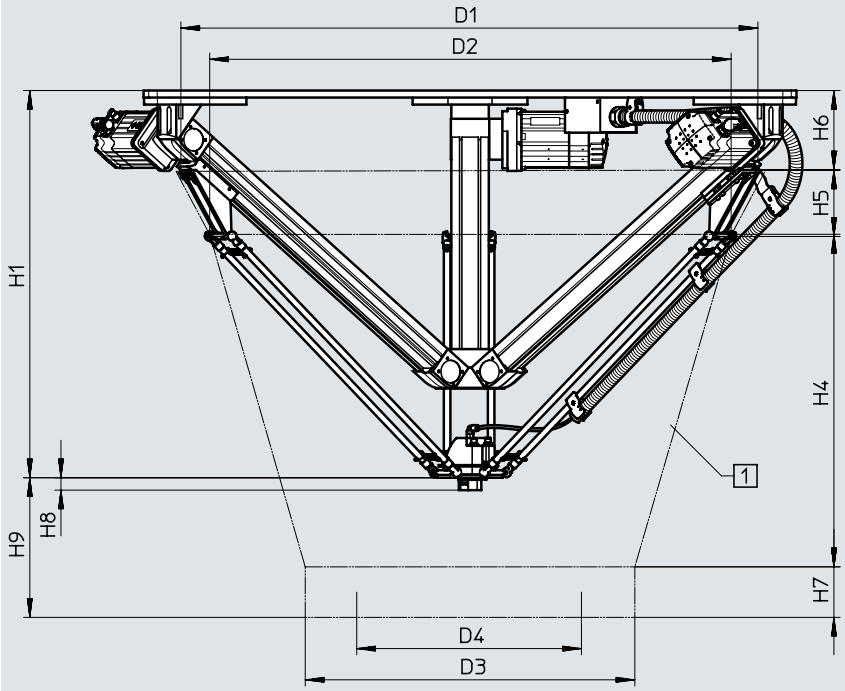
Interference contour within the nominal working area



[1] Interference contour
D3 Diameter of interference contour
D4 Diameter of nominal working area
H7 Height of nominal working area
H9 Distance from bottom edge of gripper plate to base of nominal working area

The distance specification for the working space refers to the bottom edge of the gripper plate. With the variants T1 to T4, the working space is extended downwards by the dimension H8. The same applies to attached gripper systems, where the reference point is always shifted by the height of the gripper system. Additional dimensions for laying the motor cables and tubing are not taken into account in the interference contour.

1) Choice of cable lengths: 0.5 ... 99.9 m, in increments of 0.1 m.

Ordering data

	Cable length [m]	Part no.	Type
Connection from the interface housing to the servo drive			
	**Motor cable NEBM**		
	15	**571907**	**NEBM-M12G4-RS-15-N-LE4**
	Included in the scope of delivery of the parallel kinematic system EXPT in combination with features T1 to T4.		
	**Encoder cable NEBM**		
	15	**571915**	**NEBM-M12G12-RS-15-N-S1G15**
	Included in the scope of delivery of the parallel kinematic system EXPT in combination with features T1 to T4. An additional cable is required for connection to the servo drive → front unit ERMH/support		
Connecting cable NEBU for rod loss detection or reference sensor of the rotary drive			
	5	**541334**	**NEBU-M8G3-K-5-LE3**
	10	**541332**	**NEBU-M8G3-K-10-LE3**
	15	**575986**	**NEBU-M8G3-K-15-LE3**

Accessories

Ordering data	For size	Description	Part no.	Type
Protective conduit MKG				
	95, 120	2 m are required per axis	**3156318**	**MKG-23-PG-29-B**
Tubing holder EAHM				
	95, 120	For mounting the protective conduit	**3506553**	**EAHM-E10-TH-W29**
Angle kit EAHM				
	95, 120	For mounting the tubing holder on the connection block	**2075203**	**EAHM-E10-AK**
			2075842	**EAHM-E10-AK-P8**[1]

1) In combination with the variant EXPT-...-P8

Ordering data	For size	Description	Part no.	Type
Covering kit EASC-E10				
	95	• Protects the working space against contamination by particles • Can only be fitted in combination with the variant EXPT-...-P8	**3790894**	**EASC-E10-95**
	120		**3790896**	**EASC-E10-120**
Adapter kit EAHA				
	95, 120	For suction gripper ESG- (holder size 2)	**1574224**	**EAHA-R2-M12P**
		For suction gripper ESG- (holder size 3 and 4)	**1574227**	**EAHA-R2-M14P**

Accessories

Adapter kit
DHAA, HAPG

Material:
Wrought aluminium alloy
Free of copper and PTFE
RoHS-compliant

Note
The kit includes the individual mounting interface as well as the necessary mounting material.

Gripper combinations with adapter kit
