

Characteristics

Characteristics

- Suitable for use in harsh, dusty ambient conditions
- Can be used under water
- Sturdy design
- Large force range from 1 ... 50 kN
- Low installation height
- No stick-slip effect
- Maintenance-free

EB-80

6

Bellows cylinders can be used both as driving and pneumatic spring components. When provided with pressurisation and exhaust functions, the bellows cylinders operate as a driving component. As the stroke increases, the force generated is reduced in relation to the contractional force of the bellows. When bellows cylinders are supplied with permanent pressure, they act as a cushioning component. The simple design consists of two metal connecting plates with an attached rubber bellows. There are no sealing components and no moving mechanical parts. Bellows cylinders are single-acting drives that do not require spring returns, as the reset is achieved by the application of external force.

EB-145 ... 385

Prerequisites for using a bellows cylinder Space required

2

4

5

Observe the installation space to ensure that the bellows cylinder does not come into contact with other machine parts as it expands.

Combined installation When using two or more bellows cylin-

ders, the necessary mounting plates must be inserted between the cylinders to prevent them from spreading out sideways.

Tilted installation

The maximum tilt angle α must not be exceeded to ensure that the bellows walls cannot touch.

Maximum height

The bellows cylinder must not exceed a maximum height, otherwise it will be damaged.

Lateral offset

The maximum lateral offset must not be exceeded.

Minimum height

The bellows cylinder must not fall below a minimum height, otherwise it will be damaged.

📲 - Note

- Bellows cylinders may only be moved against a workpiece, or they must be equipped with limit stops at the end of the stroke, otherwise the bellows walls would be overloaded or it would result in internal damage
- A resetting force is required to press the bellows cylinder to its minimum height. This is generally achieved through the applied weight force
- The entire bearing surfaces of the upper and lower plates must be utilised to absorb forces
- Bellows cylinders must be exhausted before disassembly
- The walls of bellows cylinders must not come into contact with other parts during operation

Thrust F and bellows volume V as a function of the stroke length H

The graph illustrates the change in thrust F with various working pressures and the change in bellows volume V in relation to the stroke length. The minimum installation height H2 must be observed to achieve the indicated forces.
