- For heavily lubricated air in the power unit
- For manifolds if the pressure zones are created via ducts 3 and 5 (not possible with 2x 3/2)
- For manifolds or pressure zones that are equipped with reversible 2x 3/2-way valves (valves on request)

#### Operation with internal pilot air supply

- For small pressure fluctuations in the power section
- For using regulator plates with vertical stacking, also in reverse operation
- As a low-cost solution

#### Reverse operation with compressed air supply via ducts 3 and 5

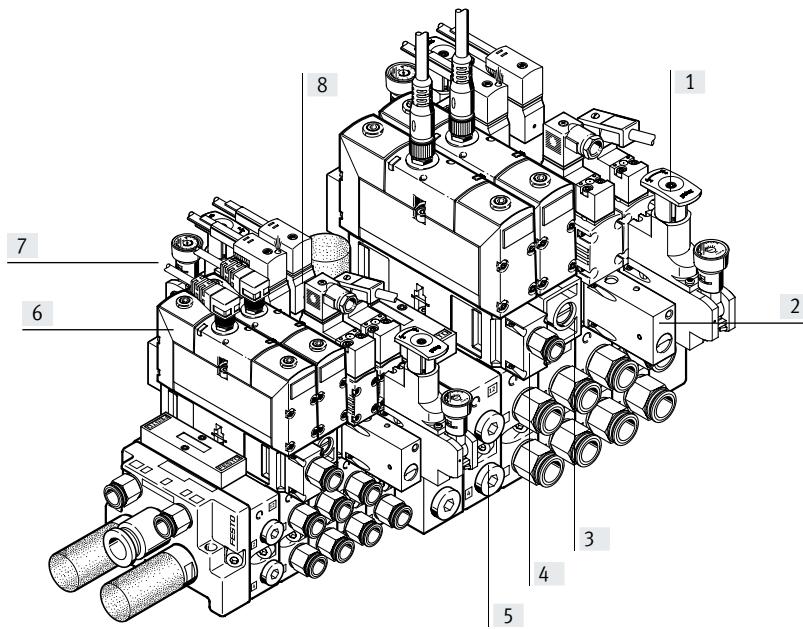

- Pressure zone separation via ducts 3 and 5
  - Example: duct 3 vacuum, duct 5 ejector pulse
  - Example: duct 3 high pressure for advancing the piston rod of a double-acting cylinder. Low pressure at duct 5 for retracting the piston rod with low energy consumption
- 2x 3/2-way valves used as 5/4-way valve with controllable overlap and pressure zone separation with the reversible variant

#### Reverse operation with a regulator plate, compressed air supply via duct 1

- Reversible pressure regulator combined with a reversible 2x 3/2-way valve regulates outputs 2 and 4
  - AB regulator for each of outputs 2 and 4
  - A regulator for output 4
  - B regulator for output 2
- Reversible pressure regulators are in the control position immediately after the power supply is switched on
  - Adjustment possible at all times
  - Dynamic response characteristics
  - Reduced regulator load because the supply pressure is maintained when the valve is switched
  - Not exhausted via the regulator

## Key features

### Valve manifold assembly VTIA with a combination of sizes and vertical stacking

- [1] Pressure regulator for adjusting the force of the actuated drive
- [2] Pressure shut-off plate for replacing valves during operation
- [3] Throttle plate for adjusting the speed of the drive
- [4] Supply plate for compressed air supply of a control chain as a separate pressure zone

- [6] Solenoid valve with central round plug
- [7] Valve size 18 mm and 26 mm in combination
- [8] Solenoid valve with individual pilot valves and port pattern to ISO 15218, can be connected using square plug sockets or round plug

### Vertical stacking function

#### Pressure regulator

- Single variant to regulate the pressure at output 4(A) or 2(B) or at input 1(P)
- Dual variant to regulate the pressure at output 4(A) and 2(B) individually
- Reverse variant for the outputs so that the regulator is in the control position
- With pressure gauge connection

#### Throttle plate

- Designed with two flow control valves for adjusting the exhaust air flow rate at exhausts 5 or 3. This allows the drive to be set in motion and the required speed to be set at the manifold using the manual override.

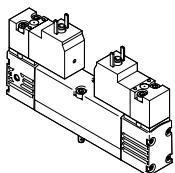

#### Vertical pressure shut-off plate

- Equipped with a switch via which the compressed air supply can be shut off. A directional control valve or downstream vertical stacking plate can thus be replaced without switching off the overall air supply.
- If the control chain has a redundant design, the cycle can continue even with cyclical control.

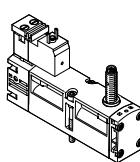

#### Vertical supply plate

- As additional air supply for a valve
- To supply a third pressure zone

### Individual connection with square plug, type C

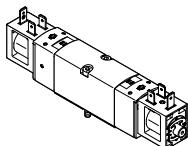

The directional control valve has a pilot control to ISO 15218 and a plug pattern to EN 175301-803, type C.

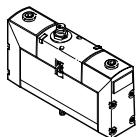

### Individual connection with square plug, with position sensing

**ISO valves with switching position sensing for safety-related pneumatic components**

The 5/2-way single solenoid valve with spring return contains an inductive sensor that monitors the normal position of the piston spool valve. This valve is not a safety device to the Machinery Directive 2006/42/EC.

For use in higher categories, the sensor signal from the valve must be evaluated by a control unit.

This valve is suitable for use in safety-related parts of control systems to EN ISO 13849-1. This valve is designed for installation in machines and automation systems and must only be used in industrial applications (high-demand mode).

The circuit diagram represents a valve with a proximity switch with a N/O switching output signal. In accordance with ISO 1219-1, this symbol is used both for normally open contacts and for normally closed contacts. The switching element function of the sensors used here is designed as an N/C contact.
