Valve terminal MPA-C

FESTO

Key features

Innovative

- Optimum design of the housing surface ensures that cleaning agents can run off, thus significantly reducing time and effort spent on cleaning
- Flow rate up to 780 l/min
- Sub-D multi-pin plug connection, front or rear
- I-Port interface/IO-Link, front or rear

Versatile

- Valves in individual grid
- System can be extended as required with individual sub-bases and modular tie rods
- Up to 32 solenoid coils
- Easy conversion and extension at a later date
- Air supply can be extended using additional pressure zones with power supply modules or sub-bases with an additional supply
- · Wide range of pressures
- −0.09 ... +0.8 MPa
- Wide range of valve functions

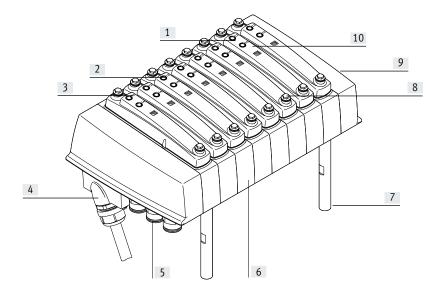

Reliable

- Use of materials that are resistant to corrosion and media
- Fast troubleshooting with LEDs on the valves
- Easy to service with replaceable valves
- Manual override, optionally non-detenting
- Efficient sealing thanks to 5 tie rods and redundant seals
- NSF-H1 lubrication, FDA-compliant materials

Easy to mount

- Supplied as ready-to-install, tested unit
- Individually configurable pneumatic connections (straight or angled fittings, or with screw-in thread)
- Reduced selection, ordering, installation and commissioning costs
- Excellent corrosion resistance and IP69K degree of protection allow mounting under harsh ambient conditions outside a control cabinet

Key features

- [1] Width 14 mm
- [2] Reduced downtime: LED signal status indicator
- [3] Modular:

 Creation of pressure zones, additional exhaust and supply possible using power supply modules or sub-bases with an additional supply
- [4] Simple electrical connection
 - Multi-pin connection
 - I-Port interface/IO-Link
- [5] Practical: pre-installed individually specified fittings
- [6] Variable:
 - 32 valve positions
 - 32 solenoid coils

- [7] Quick mounting: using screws or spacer bolts
- [8] Durable:
 - High degree of protection IP69K
 - Resistant to chemicals and cleaning agents
 - High corrosion resistance
- [9] Adaptable:
 - Selector sleeve in the end plate

for choosing the pilot air supply (internal or external)

[10] Safe operation:

Manual override, non-detenting or concealed

Equipment options

Valve functions

- 5/2-way valve, single solenoid
- 5/2-way valve, double solenoid
- 2x 3/2-way valve, normally open
- 2x 3/2-way valve, normally closed
- 2x 3/2-way valve,
 1x normally open,
 1x normally closed
- 5/3-way valve mid-position pressurised
- 5/3-way valve mid-position closed
- 5/3-way valve mid-position exhausted
- 2x2/2-way valve
 1x normally closed
 1x normally closed, reversible
- 2x 2/2-way valve normally closed
- 1x 3/2-way valve normally closed external compressed air supply
- 1x 3/2-way valve, normally open external compressed air supply

Distinctive features

- Maximum of 32 valve positions
- Maximum of 32 solenoid coils
- Parallel modular valve linking
- · Integrated holding current reduction
- Any compressed air supply
- Creating pressure zones
- Modular, individually extendable tie rods
- · Valve positions in individual grid
- Freely selectable fittings/tubing size at every port

Ordering data – Product options

Configurable product

This product and all its product options can be ordered using the configurator.

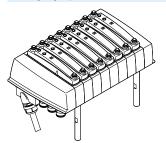

The configurator can be found at
www.festo.com/catalogue/...

Enter the part number or the type.

Part no. Type 575465 MPAC-VI

Key features

Multi-pin plug connection

The signals are transmitted from the controller to the valve terminal via a pre-assembled or self-assembled multi-wire cable to the multi-pin plug connection, which substantially reduces installation time.

The valve terminal can be equipped with max. 32 solenoid coils. This corresponds to 2 to 32 valves.
The multi-pin cable should be no longer than 30 m.

Versions:

- Sub-D connection, 25-pin
- Sub-D connection, 44-pin

I-Port interface/IO-Link

I-Port/IO-Link consists of a central master and the I-Port interface/IO-Link devices connected via special connecting cables. This enables a decentralised layout of the devices.

The connection type corresponds to a star topology.

In other words, only one module or one valve terminal can be connected to each I-Port.

The Festo I-Port interface is based on IO-Link and is therefore compatible with IO-Link in certain areas.

As well as communication, the I-Port interfaces also handle the power supply for the connected devices. The maximum length of a string is 20 m.

Versions:

• Sub-D connection, 9-pin

Modular pneumatic components

The modular design of the MPA-C provides outstanding flexibility, even at the planning stage, and makes it exceptionally easy to service during operation.

The system consists of sub-bases, valves and blanking plates.

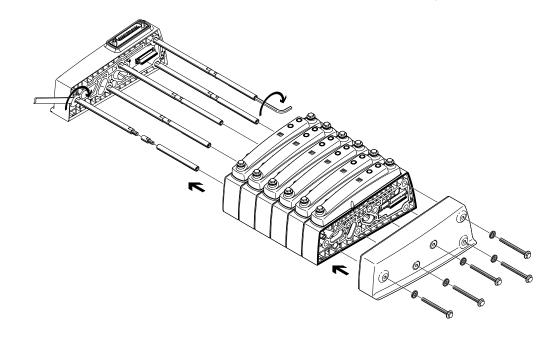

The sub-bases form the support system for the valves.

They contain the connection ducts for the compressed air supply to and exhausting from the valve terminal as well as the working ports for the pneumatic drives for every valve. The sub-bases are connected by a tie rod system. This consists of a threaded rod, threaded sleeve and screw. The threaded rod/sleeve combination is selected according to the chosen number of individual sub-bases.

A valve terminal can be easily extend-

ed by adding individual sub-bases or

supply modules. This is done by inserting suitable tie rod extenders between the threaded rod and the sleeve.

Peripherals overview

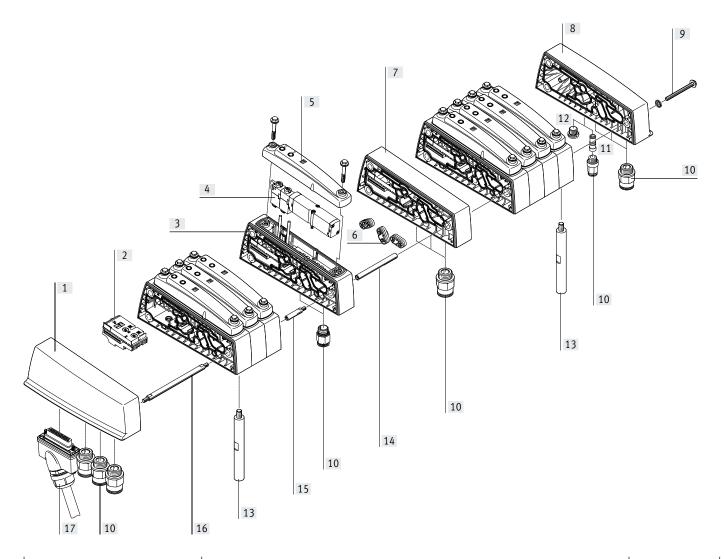

Valve terminal pneumatic components

MPA-C valve terminals with multi-pin plug connection or I-Port interface/IO-Link can be expanded by up to 32 solenoid coils/valve positions.

Every individual sub-base is available with a valve position for valves with one or two solenoid coils.

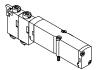

Double solenoid valve positions can be equipped with any valve or a blanking plate.

Single solenoid valve positions can only be fitted with single solenoid valves or a blanking plate.

Sub-base valve

The MPA-C offers a comprehensive range of valve functions. All valves are fitted with a piston slide and patented sealing system that facilitates efficient sealing, a wide pressure range and a long service life. They have a pneumatic pilot control for optimising performance.

The air is supplied by a central pilot air supply.

Sub-base valves can be replaced quickly since the tubing connections remain on the sub-base.

This design is also particularly flat.

Irrespective of the valve function, there are sub-base valves with one solenoid coil (single solenoid) or with two sole-

noid coils (double solenoid or two single solenoid valves in one housing).

Design

Valve replacement

The valves are located under the cover. The cover and valve are each mounted on the sub-base with two screws, which means that the valves can be easily replaced. The sturdy mechanical structure of the cover and sub-bases ensures efficient, durable sealing.

Extension

Vacant positions (blanking plates) can be replaced by valves at a later date. The dimensions, mounting points and existing pneumatic installations remain unchanged during this process. The valve code (e.g.: M, J, N, NS etc.) is located on the front of the valve under the manual override and can be read through an inspection window in the cover.

- **Î**

- Note

A filter must be installed upstream of valves operated in vacuum mode. This prevents any foreign matter in the intake air getting into the valve (e.g. when operating a suction cup with connector).

Blanking plate

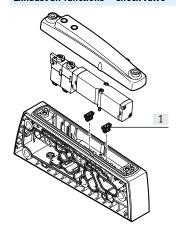

Vacant position (code L) without valve function, for reserving valve positions on a valve terminal.

The valve and vacant position are located under a blanking plate.

Using a combination of a cover and a sub-base without a valve is not permissible unless a blanking plate is also being used.

Exhaust air functions - Check valve

[1] Check valve

The check valves prevent the air from being pushed back (back pressure) from ducts 3 and 5 into the solenoid valve.

This prevents the back pressure from having a disruptive effect on other connected actuators.

The check valves are integrated into ducts 3 and 5 of the sub-bases.

The check valves should be installed according to the specifications using the enclosed assembly tool. Once installed, the check valves cannot be removed.

Please see the relevant assembly instructions:

- → www.festo.com/catalogue/...
- → Support/Downloads.

Compressed air supply and exhaust

The valve terminal MPA-C is supplied with compressed air via:

- · Right-hand end plate
- · Left-hand end plate
- Power supply modules
- Sub-bases with additional power supply

All pneumatic connections are located at the rear of the valve terminal.

Exhausting (ducts 3 and 5) can take place using a choice of:

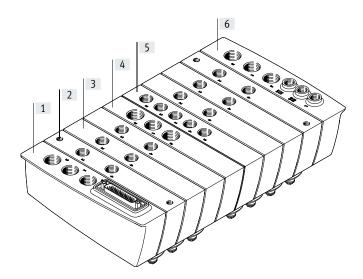

- · Right-hand end plate
- Left-hand end plate
- Power supply modules
- Sub-bases with additional power supply

Ducts 3 and 5 are routed completely separately in the terminal.

The pilot exhaust air (duct 82/84) is completely separate from ducts 3 and 5. Its port is located in the right-hand end plate, together with the ports for the pilot air supply (12/14) and the pressure compensation port (L).

All valves in the valve terminal are supplied by a common pilot air source, irrespective of the pressure zones. The supply can either be:

- Internal (from duct 1 on the righthand end plate) or
- External (from duct 12/14)

[1] Left-hand end plate with electrical connection (multi-pin or I-Port interface/IO-Link) and pneumatic ports 1, 3 and 5

- [2] Sub-base with mounting holes and pneumatic ports 2 and 4
- [3] Sub-base without mounting holes and pneumatic ports 2 and 4
- [4] Power supply module with pneumatic ports 1, 3 and 5
- [5] Sub-base with additional supply, with pneumatic ports 1, 3, 5 and 2, 4
- [6] Right-hand end plate with pneumatic ports 1, 3, 5 and L, 12/14, 82/84

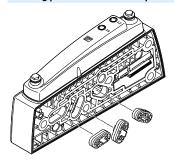

If a gradual pressure build-up in the system using a soft-start valve is selected, an external pilot air supply should be connected so the pilot pressure applied during switch-on is already at full pressure.

Creating pressure zones and separating exhaust air

The MPA-C offers a number of options for creating pressure zones if different working pressures are required.

Duct 1 and/or duct 3 and/or duct 5 are interrupted by inserting a separator in the sub-base. Every pressure zone must have its own supply.

The following supply options are available:

- · Left-hand end plate
- Right-hand end plate
- Supply module

If you are using sub-bases with an additional supply, every valve in the valve

terminal could be operated within a separate pressure zone.

A pressure zone is created by separating the internal supply ducts using a special separator. Every pressure zone must have its own compressed air supply.

Compressed air can be supplied and exhausted via a supply module and/or the right-hand end plate.

The MPA-C allows you to select any position for the supply modules and the sub-bases with pressure zone separation.

The sub-bases with pressure zone separation are integrated into the terminal at the factory as specified in your order.

They can be distinguished by their coding, even when the valve terminal is assembled. Duct separation is always to the right of the sub-base.

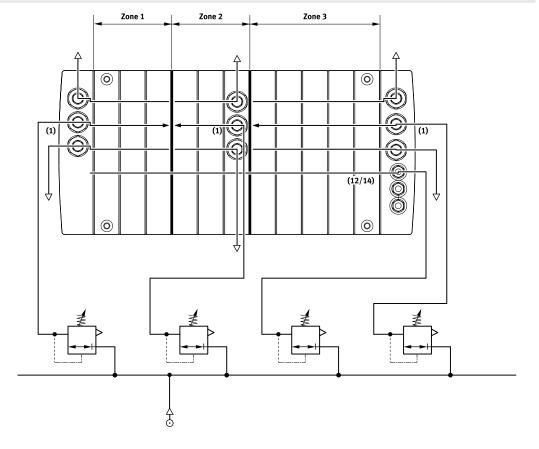

Example: compressed air supply and pilot air supply

External pilot air supply

The image opposite shows an example of creating and connecting an air supply in the case of an external pilot air supply.

The pilot air (duct 12/14) is supplied centrally to the entire valve terminal via the right-hand end plate.

Pressure zone separation is always to the right of the sub-base with separator(s).

Key features - Mounting

Sub-base

The MPA-C is based on a modular system consisting of sub-bases and valves. The sub-bases are connected by tie rods and thus form the support system for the valves.

They contain the connection ducts for supplying compressed air to and venting from the valve terminal as well as the working ports for the pneumatic drives for each valve.

The sub-bases are joined together via tie rods. The tie rod consists of a threaded rod, threaded sleeve and screw.

In principle, sub-bases have a modular structure.

The threaded rod/sleeve combination is selected according to the number and width of the individual sub-bases. To add further blocks, simply loosen the tie rod and adapt with extenders.

There are no restrictions on extensions; a tie rod could be constructed almost entirely using extenders.

Every solenoid coil must be assigned to a specific pin of the multi-pin plug for the valve to be activated. Regardless of whether vacant positions or valves are used, sub-bases occupy:

- One coil/address (single solenoid valves)
- Two coils/addresses (double solenoid valves)

Valve terminal mounting

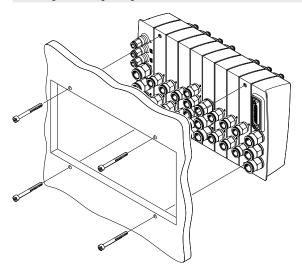

Sub-bases with threaded holes are available for the valve terminal MPA-C. The valve terminal can thus be mounted either in a control cabinet or on any even surface using spacer bolts. It can be mounted in any position. However, it should be mounted in such

a way that dirt can be cleaned off and cleaning agent can run off.

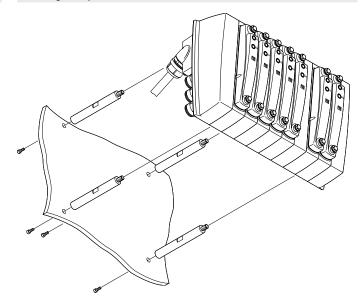

The mounting surface must be able to support the weight of the valve terminal and any forces that arise, and must enable torsion-free mounting.

Sub-bases directly connected to the right and left-hand end plates and every fifth sub-base within the valve terminal must be provided as a version with mounting holes.

Mounting with tubing through-feed

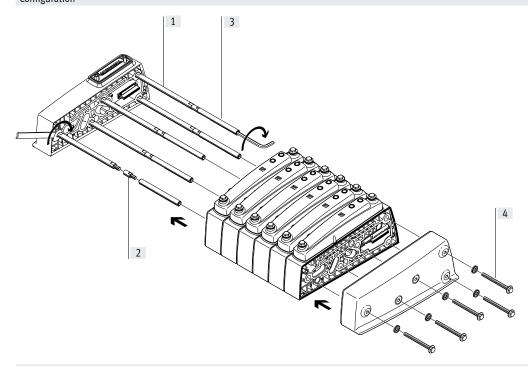

Mounting with spacer bolts

Key features - Mounting

Tie rods
Configuration

- [1] Threaded rod
- [2] Tie rod extender
- [3] Sleeve
- [4] Screw

Mode of operation

The tie rod for the MPA-C consists of four parts:

- · Threaded rod
- · Tie rod extender
- Sleeve
- Screw

This enables valve terminals of any length to be created.

It takes just 4 steps to assemble the tie rod and the valve terminal:

- Screw the sleeves to the threaded rods
- Push the rod/sleeve combination into the tie rod shafts of the sub-bases and push the supply modules onto the left-hand end plate
- Screw the rod/sleeve combination onto the left-hand end plate
- Push on the right-hand end plate and secure with screws that engage into the sleeves

The tie rod enables the valve terminal to be extended at a later date. This is done by loosening the tie rod screws and disassembling the relevant components. The additional sub-base or supply module is inserted at the required location. The previously disassembled components are then re-assembled.

To compensate for the change in length, the tie rod must be extended by the increase in length. This is done by screwing in extenders between the threaded rod and sleeve.

- Note

To ensure the valve terminal is properly sealed, you must:

- Check the seals between the sub-bases and replace them, if necessary, before the assembly stage during a conversion
- Tighten the tie rod screws in the correct order
- Tighten the tie rod screws to the correct torque

Key features - Mounting

Tie rod - Components and design

Tie rod (threaded rod)

The threaded rod is used to create a cost-optimised fixed-grid tie rod.

Tie rod extender

The valve terminal can be extended almost infinitely at any time using tie rod extenders.

The tie rod extenders are inserted between the threaded rod and the sleeve.

Sleeve

The primary purpose of the sleeve is to compensate for tolerances that occur, for example, when the seals are compressed between the sub-bases during assembly

The sleeves come in different lengths, tailored to the use of a tie rod in a fixed grid as well as generally for the individual modular tie rods.

Screw

The entire valve terminal is clamped via the tie rod using the screw. Tolerances that occur, for example when the seals are compressed between the sub-bases during assembly, are compensated by the interaction of the screw and sleeve.

Individual modular tie rod

Tie rods can be constructed entirely using tie rod extenders. The threaded rod and sleeve are required to compensate for tolerances that occur, for example,

when the seals are compressed between the sub-bases during assembly.

Fixed-grid tie rod with extension

The tie rod extenders are inserted between the threaded rod and the sleeve.

They are available in suitable lengths for sub-bases and supply modules.

Fixed-grid tie rod

The fixed-grid tie rod minimises assembly costs when assembling previously specified valve terminals. These valve terminals can be extended at any time. The threaded rod and, if applicable, the sleeve must be replaced if the valve terminal length is reduced.

Key features - Display and operation

Display and operation

Signal status indication

Every solenoid coil is allocated an LED that indicates its signal status.

- Indicator 12 shows the signal status of the coil for duct 2
- Indicator 14 shows the signal status of the coil for duct 4

Manual override

The manual override (MO) enables the valve to be switched when not electrically activated or energised.

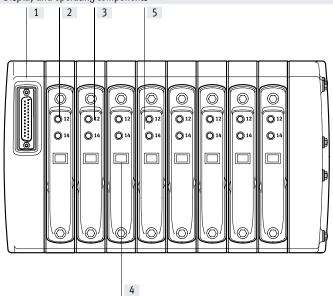

The valve is switched by pushing the manual override.

Cover

The inspection window for signal display and valve identification and the mechanism of the manual override are in the cover.

The valves below are nevertheless always fitted with switching status indicators and manual override.

Display and operating components

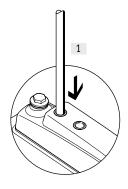

- [1] Left-hand end plate with electrical connection (multi-pin plug or I-Port interface/IO-Link)
- [2] Manual override (per pilot solenoid coil, non-detenting)
- [3] Signal status display (per pilot solenoid coil)
- [4] Inspection window for valve identification
- [5] Cover without manual override

· 🖣 - Note

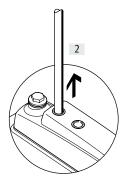

A manually actuated valve (using the manual override) cannot be reset electrically.

Conversely, an electrically actuated valve cannot be reset by the manual override.

Manual override (MO)

[1] Press in the plunger of the MO with a blunt plastic pin.The pilot valve switches and actuates the main valve.

[2] Remove pin.

The spring force pushes the plunger of the manual override back.

The pilot valve returns to the normal position as does the single solenoid main valve (this is not the case with a double solenoid valve).

Key features - Display and operation

Display and operation

Labelling

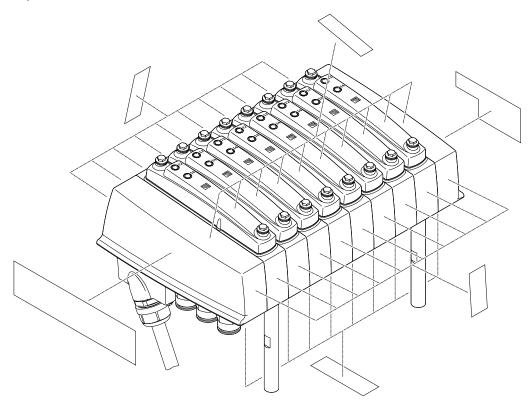

The following can be used as labels:

- Laminated thermal transfer stickers
- Laser-printed stickers
- Laser printing directly onto the valve terminal surface

Labels can be applied to all sides of the valve terminal and to its individual components. The possible size of the labelling surfaces can be taken from the dimensional drawing

(→ page 30)

It is not possible to label the valves located beneath covers in addition to the information printed by the manufacturer The valve positions are therefore labelled on the covers or on the sub-bases

When applying labels, the requirements in terms of cleaning and environmental emissions must be observed, especially for stick-on labels.

Electrical power as a result of current reduction

Every solenoid coil is protected with a spark arresting protective circuit as well as against polarity reversal.

All valve types also have an integrated current reduction.

MPA-C valves are supplied with operating voltage 24 V (permissible voltage fluctuations +/-25%).

Electrical connection - Left-hand end plate

The electrical connection from the valves to the higher-order controller is in the left-hand end plate.

Switching between the various connection options is easy: simply swap the

left-hand end plate; the pneumatic connections remains as they are.

The valves are switched by positive or negative logic (PNP or NPN). Mixed operation is not permitted.

Guidelines on addressing for valves/solenoid coils

The addresses are numbered from left to right in ascending order. The following applies for the individual valve positions: address x for coil 14 and address x+1 for coil 12.

Every sub-base occupies a specific number of addresses/pins:

- For 1 solenoid coil: 1
- For 2 solenoid coils: 2

Note

If a single solenoid valve is assembled on a double solenoid valve position, the second address (for coil 12) is also assigned and cannot be used.

I-Port interface/IO-Link

The I-Port interface/IO-Link enables the valve terminal MPA-C to be connected to the following systems:

- I-Port master from Festo (CPX terminal)
- Bus node CTEU from Festo
- IO-Link master
 The maximum distance between the
 I-Port/IO-Link master and valve terminal with I-Port interface/IO-Link is
 20 m.

The 5-pin connecting cables contain the power supply for the valves; the power supply for the internal valve terminal electronics and the control signals are separate from this.

Instructions for use

Service fluids

Operate your system with unlubricated compressed air, if possible. Festo valves and cylinders are designed so that, if used as intended, they will not require additional lubrication and will still achieve a long service life.

The quality of compressed air downstream of the compressor must correspond to that of unlubricated compressed air. If possible, do not operate the entire system with lubricated compressed air. The lubricators should, where possible, always be installed directly upstream of the actuator requiring them.

Incorrect additional oil and too high an oil content in the compressed air reduce the service life of the valve terminal.

Use Festo special oil OFSW-32 or the alternatives listed in the Festo catalogue (as specified in DIN 51524 HLP32; basic oil viscosity 32 CST at 40°C)

Bio-oils

When using bio-oils (oils which are based on synthetic or native esters, e.g. rapeseed oil methyl ester), the maximum residual oil content of 0.1 mg/m³ must not be exceeded (see ISO 8573-1 Class 2).

Mineral oils

When using mineral oils (e.g. HLP oils to DIN 51524, parts 1 to 3) or similar oils based on poly-alpha-olefins (PAO), the maximum residual oil content of 5 mg/m³ must not be exceeded (see ISO 8573-1 Class 4).

A higher residual oil content is not permitted, regardless of the compressor oil, because permanent lubrication would otherwise be flushed out over a period of time.

- N - Flow rate up to 780 l/min

- **[]** - Valve width 14 mm

- **** - Voltage 24 V DC
