# Valve manifold assembly CPV10-EX-VI, Compact Performance

# **FESTO**

#### Innovative

- Cubic design for exceptional performance and low weight
- Sturdy
- Optimised for installation in a control cabinet
- Suitable for pilot control of process valves
- High flow rate with extremely compact design

#### Versatile

- Up to sixteen 2/2- or 3/2-way valves per valve manifold assembly, in one slice thanks to dual function
- Flexible and cost-effective connection of two to eight valve slices
- Highly flexible thanks to:
  - various pneumatic functions (valve variants)
  - different pressure ranges
- Separator plates for creating pressure zones
- Blanking plates for later extensions

#### Reliable

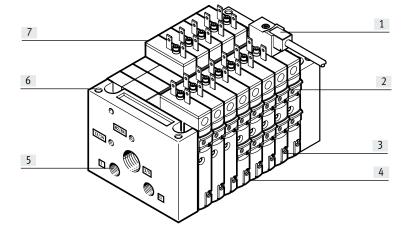

- Manual overrides for valves
- Protection class to IP65 in the control cabinet
- Intrinsically safe valve manifold assembly to ATEX category 2 (zone 1)
- Extremely robust thanks to the metal valve design
- Long service life

### Easy to assemble

- Ready-to-install and tested unit
- Reduced costs for selection, ordering, assembly and commissioning
- Secure wall mounting or H-rail mounting
- Pneumatic multiple connector plate

   quick replacement of the valve
   block with the tubing in place
- Valve assembly optimised for control cabinets

#### Main features

- [1] Inscription labels
- [2] Safe operation:
  Manual override, non-detenting,
  detenting or blocked
- [3] Comprehensive range of valve functions, pressure zone formation, blanking plates
- [4] Width
  - 10 mm
- [5] Robust metal thread or pre-assembled QS connectors
- [6] Quick to mount:
  - directly using screws
  - on an H-rail
  - via the pneumatic multiple connector plate
- [7] Simple electrical connections:
  - individual connection

#### **Equipment options**

Valve functions

- 5/2-way valve, single solenoid
- 5/2-way valve, double solenoid
- 2x 3/2-way valve, normally open
- 2x 3/2-way valve, 1x normally open, 1x closed
- 2x 3/2-way valve, normally closed
- 2x 3/2-way valve, normally closed, with integrated back pressure protection
- 5/3-way valve1)
- 2x 2/2-way valve, normally closed
- 2x 2/2-way valve, 1x normally open, 1x closed

### Special features

#### Individual connection

• 2 ... 8 valve positions, max. 16 solenoid coils

### Intrinsically safe

The valve manifold assembly CPV10 EX-VI has an intrinsically safe design for applications in potentially explosive areas to ATEX category 2 (zone 1)

sive areas to ATE

1) Via function block, not in combination with pneumatic multiple connector plate

### Pneumatic multiple connector plate

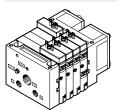

Pneumatic multiple connector plate for wall through-feed enables installation in a control cabinet; IP65 sealing

### Operation

Control only with intrinsically safe circuit with individual valve connection

#### **Electrical connections**

Individual connection in explosion-proof design

The CPV10-EX-VI is a valve manifold assembly with an intrinsically safe design for use in zone 1 potentially explosive areas (ATEX category 2 G).

Definition of intrinsically safe:
A system comprising electrical output and solenoid coils is designed in such a way that no spark or thermal effect

can cause ignition in an explosive atmosphere. Each solenoid coil must be connected to an intrinsically safe circuit that complies with ignition protection type ia IIC or ib IIC. 2 to 16 solenoid coils (divided between two to eight valve slices, including odd numbers) can be selected with individual connection.

#### Range of application

Explosive gases or dusts are present in many applications. In this case, devices with enhanced explosion protection requirements (category 2 corresponding to zone 1) are needed. Sparking, as can occur for example when switching off a solenoid coil, must be reliably prevented. There are different ways of doing this. Solenoid coils in this area are often of "intrinsically safe" design. Here, intrinsically safe means that no spark or thermal effect can occur that would cause ignition of the explosive atmosphere.

The valve manifold series CPV10 is already approved for explosion-protected areas to ATEX. This approval is for category 3. This corresponds to zone 2, in which an explosive atmosphere does not normally occur, or occurs only briefly.

The valve manifold assembly CPV10-EX-VI extends this function to higher ATEX requirements:

Approval for category 2, zone 1.

The intrinsically safe valve manifold assembly has an integrated protective circuit which prevents ignition of gas, mist or vapour. Circuits for intrinsically safe solenoid coils are furthermore designed in such a way that only low voltages and energies can occur. The valve manifold assembly is therefore equipped with individually connected valves.

The CPV10-EX-VI must only be operated in suitable intrinsically safe circuits.

In process technology, valves for piloting process valves are frequently installed in the control cabinet. The pneumatic multiple connector plate for control cabinets CPV10-VI-...-M7-C or -D simplifies installation of the pneumatic connections. Instead of several different bulkhead fittings with tubing, the installation can be carried out using just a single through-hole in the wall. Protection class IP65 is achieved via a sealing ring suitable for closed control cabinet assembly. With the pneumatic multiple connector plate the valve manifold assembly CPV10-EX-VI can be operated in suitable control cabinets in zones 1 and 21 (ATEX category 2 GD).

#### Ordering data - Product options

Configurable product
This product and all its product
options can be ordered using the configurator.

The configurator can be found at

Enter the part number or the type.

Part no. Type 539506 CPV10-EX-VI

### Key features - ATEX

#### Certifications

In accordance with EU Directive 94/9/EC (ATEX Directive) Use in potentially explosive atmospheres II 2G Ex ib IIC T4 Gb II 2D Ex ib IIIC T100°C Db  $-5^{\circ}$ C  $\leq$  Ta  $\leq$  50°C

#### CPV use in Zone 1/2

Intrinsically safe valve manifold assembly in a control cabinet. Actuation via multi-core connecting cable.

#### CPV use in Zone 1/2

Intrinsically safe valve manifold assembly (pneumatic multiple connector plate) and remote I/O in a control cabinet.

#### What does ATEX mean?

Explosive atmospheres are a constant hazard in the chemical and petrochemical industries because of the processing techniques used. These explosive atmospheres are caused by escaping gas, vapour and mist, for example.

Explosive atmospheres can also occur in mills, silos and sugar and feed processing plants because of the dust/oxygen mixtures there. Electrical equipment in potentially explosive areas is therefore subject to a special directive,

the ATEX Directive (ATEX 95a). This directive was also extended to non-electrical equipment on 1 July 2003.

#### What does ATEX 95a stand for and what does it mean?

- ATEX is an acronym of the French expression "Atmosphère explosible"
- ATEX 95a refers to Article 95a of the corresponding EC treaty
- ATEX 95a is merely the working title

ATEX 95a is backed by **Directive 94/9/EC:** 

- Directive 94/9/EC stipulates the minimum safety requirements for equipment and protective systems to be operated in explosive atmospheres.
- It applies to all EU member states.
- It relates to both electrical and non-electrical equipment.

#### What are the main new elements of Directive 94/9/EC?

- The scope of application now also covers non-electrical equipment such as cylinders, pneumatic valves, service unit components and accessories.
- The devices are approved for specific categories. The categories are allocated to zones in which the devices can be used.
- Each piece of equipment must be supplied with operating instructions and a conformity declaration.
- The manufacturer's quality system must comply with specifications that go beyond ISO 9001.
- The new devices are identified by explosion protection and CE markings.
- Dust explosion protection now also falls within the scope of this directive.
- Basic safety requirements are specified.
- It applies both to mining and all other potentially explosive areas.
- It applies to complete protective systems.

Explosio	Explosion protection classes

#### CPV - The benefits at a glance

The valve assembly CPV has a unique design. It allows a flexible mix of pneumatic performance, electrical connection technologies and a variety of installation types. In particular, the pneumatic multiple connector plate enables especially space-saving installation in control cabinets. The valve manifold assembly can often be installed directly in the previously unused wall area of the control cabinet. There is no need to connect up the valves inside the cabinet. All tubes can be connected on the outside. Instead of individual drilled holes, the

pneumatic multiple connector plate needs just one rectangular throughhole. The generously sized flow ducts and powerful flat plate silencers ensure high flow rates.

All valves are provided as valve slices. They have a compact and flow-optimised design. With two functions per valve slice (e.g. 2x 3/2-way valves), double the component density can be achieved. This saves space and reduces costs.

The cubic design permits exceptional performance with a comparatively low weight. These advantages become

clear when the valve manifold assembly is moved along on a drive.

Despite it being compact, it is also very sturdy. The connecting threads and mounting attachments are metal.

The manual override for the valves can be adapted for different operating situations. If, for example, a detenting manual override is required for set-up, this can later be easily changed again so that inadvertent actuation during operation is prevented.

#### The design principle

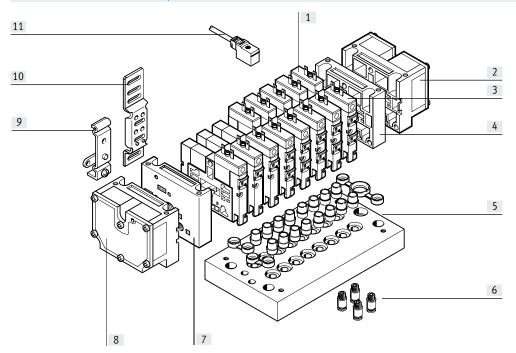

Each side of the cubic design has its own specific function. Thus, for example, the electrical connection is mounted on the top.

The different possible combinations allow the best possible solution for the task in hand.

- Pneumatic supply connections on the left, right or underneath
- Pneumatic working ports and function blocks (vertical stacking) underneath
- Manual operation from the front
- · Electrical connection surface on top
- Mounting surface on rear, or at the front via pneumatic multiple connector plate

# Peripherals overview

#### Valves

Valves CPV are implemented as valves with integrated sub-base, i.e. in addition to the valve function they also include all pneumatic ducts for supply, exhaust and for the working ports. The supply ducts are the central

component of the valve slices and enable a direct flow through the valve slices

so that maximum flow rates can be achieved. All valves have a pneumatic pilot control for optimising

performance. The valve function is based on a piston spool system with patented sealing principle, ensuring a broad range of applications and long service life. The valve manifold assembly is not suitable for vacuum operation!

Valve fur	nction   Circuit symbol	Description
M	14 4 2 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1	5/2-way valve, single solenoid Pneumatic spring return Piston spool valve

Pneumatic multiple connector plate P, M: Not in first or last valve position. Pneumatic multiple connector plate GQC, GQD: Cannot be used.

#### Creating pressure zones

Two pressure levels per valve are created using different pressure at port 1 and 11. Thus, for example, a cylinder drive can be advanced with high pressure and retracted with low pressure to save energy.

The maximum possible number of pressure zones is determined by the combination of the following components:

- Use of a separator plate
- Type of end plate pair

• Valve slice type

Separator plates can be used to divide the valve manifold assembly CPV into 2 to 4 pressure zones.

Separato	or plates	
Code	Graphical illustration	Note
T	Separator plate for creating pressure zones, supply duct 1 and 11 are separate  82/84 12/14 3/5 1 11	Using one separator plate (code T), only the air supply duct (port 1 and 11) is interrupted to allow two pressure levels.  Not in the first or last valve position  Not with compressed air supply A, B, C, D, U, V, W, X
S	Separator plate for creating pressure zones, supply duct 1, 11 and exhaust 3, 5 are separate  82/84  12/14  3/5  1  11	The separator plate (code S) divides the exhaust duct 3/5 as well as the supply duct 1 and 11. This plate is used to prevent back pressures on adjacent valve functions.  Not in the first or last valve position  Not with compressed air supply A, B, C, D, U, V, W, X  (single-side compressed air supply)
L	Blanking plate (vacant position)  82/84  12/14  3/5  1  11	A blanking plate (code L) is used to provide a vacant position at which a valve can be inserted later.

#### **Examples: Pneumatic supply**

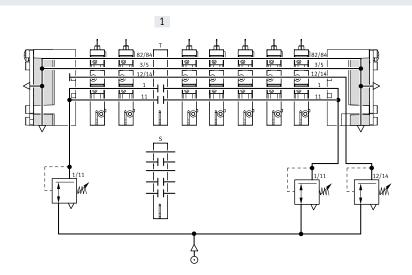

External pilot air supply, flat plate silencer at both ends

Compressed air supply via pneumatic multiple connector plate:

Code H

The diagram on the right shows an example of the configuration and connection of the compressed air supply with external pilot air supply. Port 12/14 on the pneumatic multiple connector plate is equipped with a fitting for this purpose. Ports 3/5 and 82/84 are exhausted via the flat plate silencers. A separating seal each can be optionally used to create pressure zones.

[1] Optional separating seal

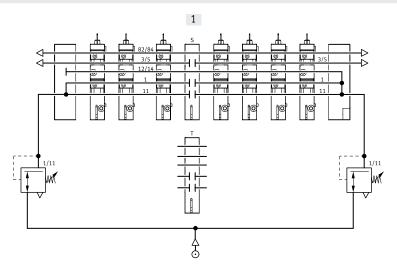

#### Internal pilot air supply, ducted exhaust air or threaded silencer

Compressed air supply via end plates: code Z

The diagram on the right shows an example of the configuration and connection of the compressed air supply with internal pilot air supply. The pilot air supply is branched from port 1 or 11 via the right-hand end plate. The exhaust 3/5 and 82/84 is expelled via the threaded silencer.

A separating seal each can be optionally used to create pressure zones.

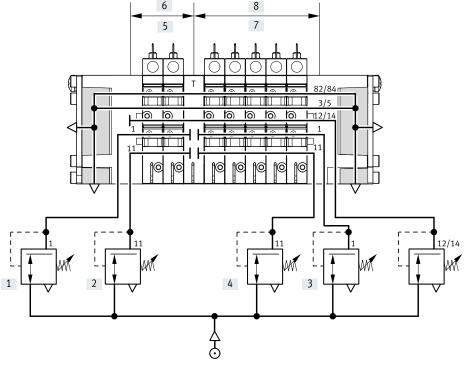

[1] Optional separating seal

#### **Examples: Creating pressure zones**

CPV with separator plate T

Up to 4 pressure zones can be created on valve manifold assemblies CPV. The diagram shows an example of the configuration and connection of four pressure zones using separator plate code T – with external pilot air supply.

- [1] Forward stroke 8 bar
- [2] Return stroke 3 bar
- [3] Forward stroke 6 bar
- [4] Return stroke 4 bar
- [5] Zone 1
- [6] Zone 2
- [7] Zone 3
- [8] Zone 4

#### Compressed air supply and exhaust

A characteristic feature of a valve manifold assembly CPV is the two end plates which supply the valve slices with pressure and exhaust them.

- Large duct cross sections enable very high flow rate performance, even with several valves switching simultaneously
- Large flat plate silencers in the end plates
- Internal/external pilot air supply

Each individual valve is supplied with compressed air from two individual ducts (supply ports 1/11) and exhausted via a large integrated exhaust duct (exhaust 3/5). This design allows

unique functionality and flexibility, making it very easy to have multiple pressure zones per terminal.

The valve manifold assembly is supplied via end plates, either on the left, on the right or on both sides.

#### Pilot air supply

Internal pilot air supply

This can be selected if the supply pressure at pneumatic port 1 is 0.3 ... 0.8 MPa. With internal pilot air supply the branch is located in the left or right-hand end plate. There is no port 12/14.

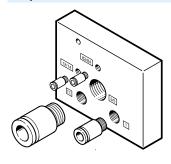

External pilot air supply is required if the supply pressure at pneumatic port

#### External pilot air supply

1 is lower than 0.3 MPa or higher than 0.8 MPa. In this case, a pressure of 0.3 ... 0.8 MPa is applied at port 12/14.

If a gradual pressure build-up in the system using a soft-start valve is required, an external pilot air supply should be selected. In this case, the control pressure applied during switchon is already very high.

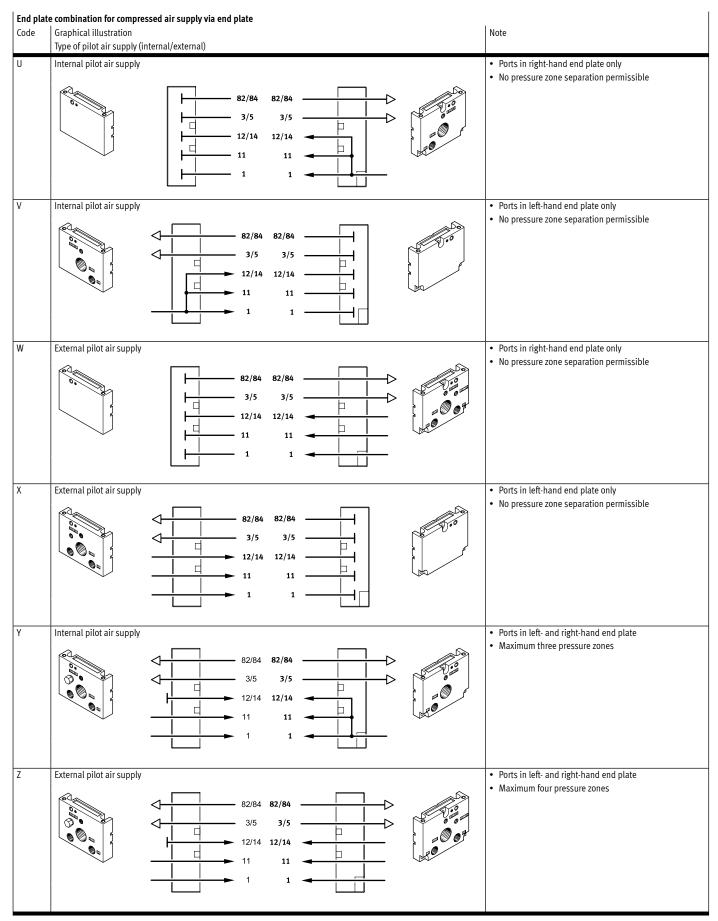

#### **End plates**

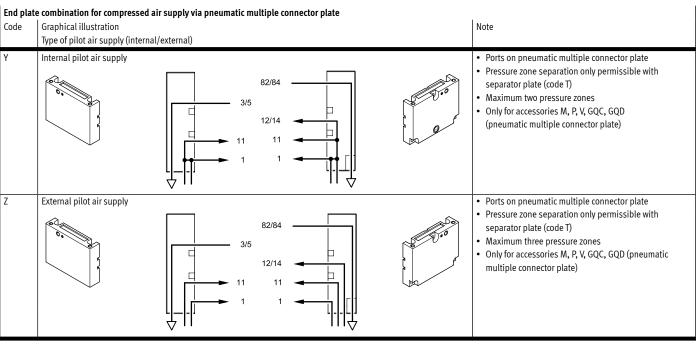

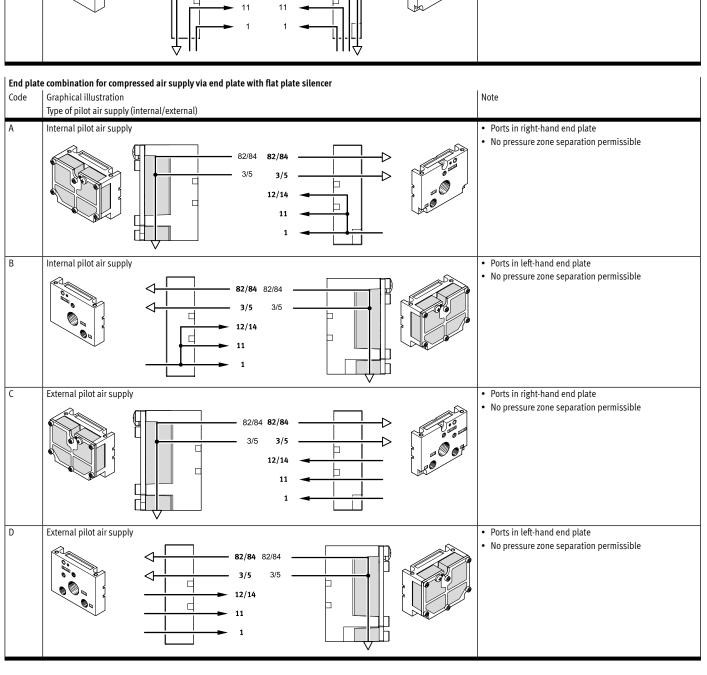

Example of an end plate:

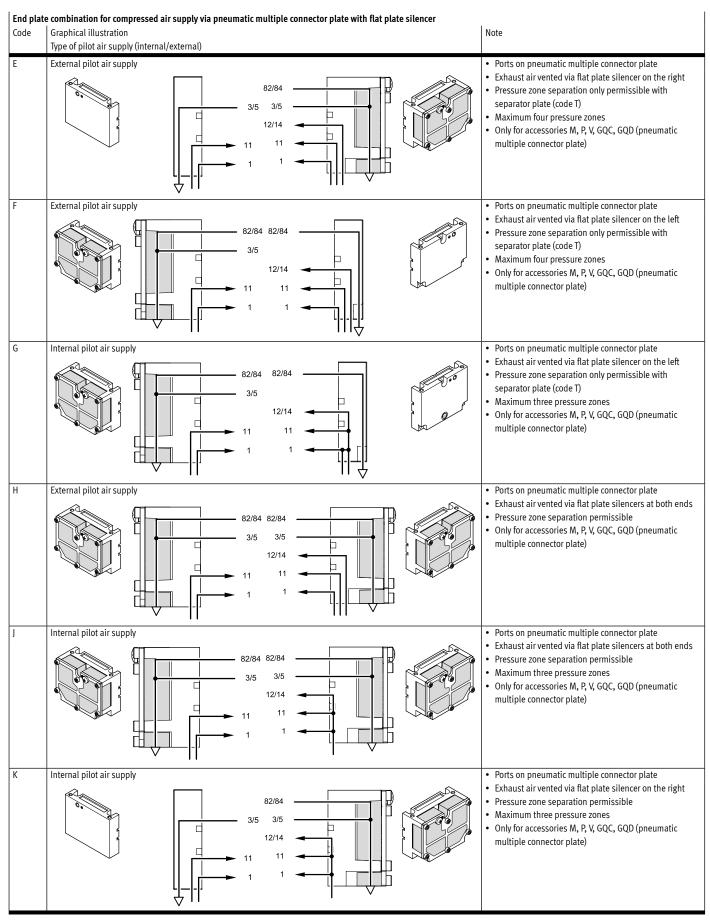

The diagram shows a left-hand end plate with external pilot air supply. The exhaust ports 3/5 and 82/84 can be equipped with fittings or silencers. An end plate for internal pilot air supply does not have ports 12/14 and 11. Port 82/84 is always present and should be fitted with a silencer. With an end plate for internal pilot air

supply, port 12/14 is connected internally to port 1.

#### Pneumatic connection

The working lines are located directly in the valve slices. Threaded connections and Quick Star push-in fittings (QS) are available for different tubing

The supply ports are located in the end plates or in the pneumatic multiple connector plate.

Push-in fittings are available fully assembled.

The following working lines can be selected:

- Threaded connections: code C
- Push-in fittings, large: code D
- Push-in fittings, small: code E
   Connection sizes for threads and QS push-in fittings can be found in the table below.

#### Pneumatic multiple connector plate

One-piece sub-bases are available for use with a pneumatic multiple connector plate; these contain the working ports and optionally also the supply ports. This allows the valve manifold assembly as a pneumatic "function" to be separated from the ports.

The pneumatic multiple connector plate enables different types of mounting, from wall mounting to direct passage through a housing wall.

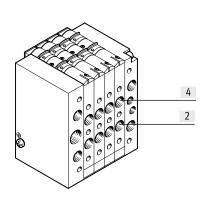

Easy-to-service and flexible connection technology thanks to:

- Common connection via the pneumatic multiple connector plate with all connections on one side
- For mounting/dismounting, the valve manifold assembly is secured/ released using just four screws

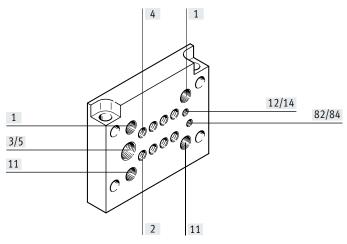

while the pneumatic tubing remains connected

- Minimal time required for mounting/dismounting
- No faults during recommissioning caused by incorrectly connected tubing

#### Valve manifold assembly CPV with valve extensions

Function blocks

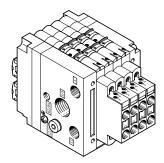

CPV10-BS-5/3G-M7

Valve kit 5/3G for creating a 5/3-way function, mid-position closed:
The valve function "mid-position closed" is created using a valve slice with 2x 3/2-way valve, normally closed (code C).

The valve kit CPV10-BS-5/3G-M7 (incorporating a double piloted check valve function) is used for this.
The valve kit is intended for use with one working pressure for each valve

slice, i.e. it must not be used in dual-pressure operation (different pressure at port 1 and 11).

#### Additional functions for valve positions

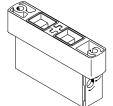

The valve manifold assembly CPV can be enhanced with further pneumatic functions with the aid of these valve extensions (vertical stacking):

- One-way flow control valves x2 for flow control directly at the valve manifold assembly for
  - Supply air flow control
  - Exhaust air flow control

#### Note

The additional functions cannot be used on the first or last valve position in combination with a pneumatic multiple connector plate M, P, and cannot be used at all in combination with a pneumatic multiple connector plate GQC, GQD.

CPV10-BS-2xGRZZ-M7

- · Additional function code P

CPV10-BS-2xGRAZ-M7

- 2x one-way flow control valve for exhaust air flow control
- Additional function code Q

# Key features - Mounting

#### **Mounting options**

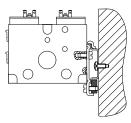

The valve manifold assemblies have drilled holes for four retaining screws, with the side for the pneumatic fittings being the screw-on surface. These drilled holes are also used to mount a valve manifold assembly on the pneumatic multiple connector plate.

As well as this type of mounting, there are other mounting options:

- H-rail mounting
- Wall mounting
- Wall mounting via pneumatic multiple connector plate with flange
- On rear side via wall mounting
- On the front
- Mounting via through-hole in wall

The mountings are attached to the leftand right-hand end plates using a screw and a fixing bolt.

#### Mounting for H-rail

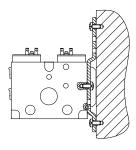

For valve manifold assembly CPV10: CPV10/14-VI-BG-NRH-35 (Mounting code H)

H-rail to EN 60715 not for accessories M, P, V (pneumatic multiple connector plate)

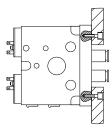

#### Attachment for wall mounting

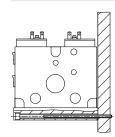

For valve manifold assembly CPV10: CPV10/14-VI-BG-RWL-B (Mounting code U)

Through-hole in wall, e.g. on the machine

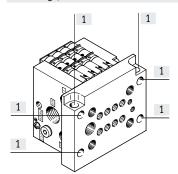

Wall mounting via pneumatic multiple connector plate

### Key features - Mounting

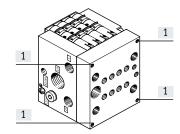

#### Pneumatic multiple connector plate for wall/machine mounting

With flange, code P

- Multiple connector plate protrudes at the end plates
- Through-holes for mounting (no thread) in the flange
- Two additional holes running crossways through this pneumatic multiple connector plate also allow rear mounting of valve manifold assembly CP.

#### Without flange, code M

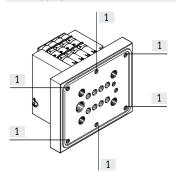

- Multiple connector plate ends flush with the end plates
- Mounting holes (with thread) for wall or base mounting in the connection side of the pneumatic multiple connector plate

#### [1] Mounting holes

# Pneumatic multiple connector plate for control cabinet installation

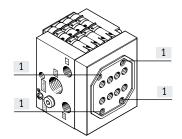

With supply ports, code GQC

- Multiple connector plate protrudes at the end plates
- Mounting holes (with thread) in the flange
- Multiple connector plate with seal

### [1] Mounting holes

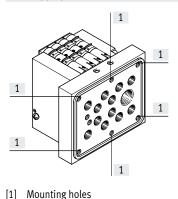

Without supply ports, code GQD

- Multiple connector plate ends flush with the end plates
- The mounting holes (with thread) are in the connection side of the pneumatic multiple connector plate
- Multiple connector plate with seal

### [1] Mounting holes

With supply ports, code GQE

- Multiple connector plate protrudes at the end plates
- Mounting holes (with thread) in the flange
- Multiple connector plate with seal
- Working port 1/8"

### [1] Mounting holes

#### [1] Mounting notes

When using the pneumatic multiple connector plate M or P, the outermost valve slices cannot be fitted with valve extensions (e.g. one-way flow control valve).

Valve manifold assemblies CPV with flat plate silencer can only be mounted on a wall. When using the pneumatic multiple connector plate GQC, GQD or GQE, the following restrictions apply:

- In general, no valve extensions can be fitted
- Cannot be combined with H-rail mounting
- Cannot be combined with wall mounting

# Key features – Display and operation

#### Manual override

Three types of manual override are available:

- Non-detenting via slide
- Detenting
- Blocked

A subsequent conversion of the manual override (MO) from non-detenting to detenting or blocked is possible at any time.

To do this, the valve locking mechanism must first be removed. This is only possible when the individual valve is not installed or by removing the tie rod on the valve manifold assembly.

Note

Follow the instructions in the user documentation when doing this.

		assembly.
Code	Graphical illustration	Note
N	Manual override, non-detenting	In the "non-detenting" version, a locking mechanism prevents the blue slider from moving. The manual override is activated using a pointed object (ballpoint pen or similar) through the opening.
R	Manual override, detenting	In the "detenting" version, the manual override is activated by sliding the slider. A locking mechanism can be used to provide the non-detenting function.
V	Manual override, blocked	In the "blocked" version, the detenting or non-detenting activation is prevented by a cover. As with the non-detenting locking mechanism, this can be added subsequently, but then remains on the valve.

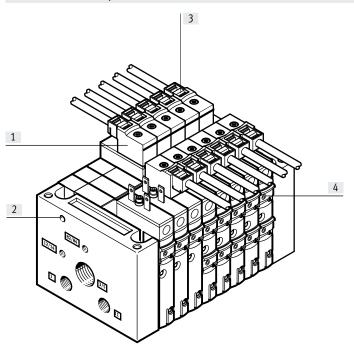

# Key features – Display and operation

### Display and operation

- [4] Manual override

# Key features - Electrical components

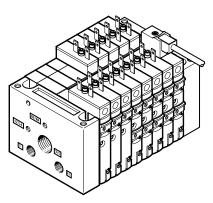

#### **Electrical connection**

Individual connection

The corresponding connecting cables are generally designed without an LED. The CPV10-EX-VI is only approved for use in suitable intrinsically safe

circuits. A wide range of well-known manufacturers (list on request) offer appropriate controllers, barriers or

fieldbus circuits with intrinsically safe outputs.

2 to 16 solenoid coils (divided between 2 to 8 valve slices) can be selected, including odd numbers. The pneumatic multiple connector plate can only be used with an even number

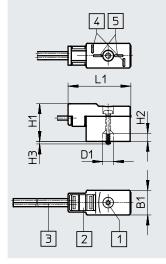

The maximum total length of the electrical connecting cables per coil is 30 m.

This value also applies when the valve manifold assembly is installed in a control cabinet.

### Instructions for use

#### Service fluids

Operate your system with unlubricated compressed air if possible. Festo valves and cylinders are designed so that, if used as intended, they will not require additional lubrication and will still achieve a long service life.

The quality of compressed air downstream of the compressor must correspond to that of unlubricated compressed air. If possible, do not operate the entire system with lubricated compressed air. The lubricators should, where possible, always be installed directly upstream of the actuator requiring them.

Incorrect additional oil and too high an oil content in the compressed air reduce the service life of the valve manifold assembly.

Use Festo special oil OFSW-32 or the alternatives listed in the Festo catalogue (as specified in DIN 51 524 HLP32; basic oil viscosity 32 CST at

#### **Bio-oils**

When using bio-oils (oils which are based on synthetic or native esters, e.g. rapeseed oil methyl ester), the maximum residual oil content of 0.1 mg/m³ must not be exceeded (see ISO 8573-1 Class 2).

#### Mineral oils

When using mineral oils (e.g. HLP oils to DIN 51 524, parts 1 to 3) or similar oils based on poly-alpha-olefins (PAO), the maximum residual oil content of 5 mg/m³ must not be exceeded (see ISO 8573-1 Class 4).

A higher residual oil content is not permitted, regardless of the compressor oil, because the permanent lubrication would otherwise be flushed out over a period of time.
