

Semi-rotary drives DSR/DSRL

FESTO

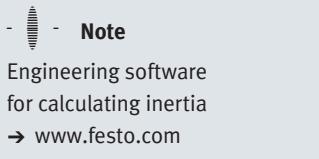

Key features

Brief description

The semi-rotary drive transmits the force directly to the drive shaft via the vane. The swivel angle is infinitely adjustable from 0 ... 184° (DSRL-10 and 12: 0 ... 181°). The adjustable stop system is separate from the vane so that any forces occurring are absorbed by the stop blocks. The stops are cushioned in the end positions by elastic polymer pads.

DSRL-...-FW

The versions with hollow flange shaft can convey liquid or gaseous media, or tubing and electric cables. The force is transmitted directly and without backlash via a multiple splined shaft.

Key features

Free wheel unit for indexing motion

The free wheel unit is an attachment that is mounted on the drive shaft of the semi-rotary drive DSR. It converts the oscillating rotary motion of the semi-rotary drive into a smooth, synchronous motion. The drive shaft of the semi-rotary drive only moves clockwise or anticlockwise so that it is possible to set infinitely adjustable feed rates.

The minimum possible swivel angle is 0.4°. Switching accuracy is also dependent on the switching speed and load.

Note

The load must be stopped externally!

FLSR-...-L (anticlockwise)

Datasheet

Max. permissible mass moment of inertia

Mass moment of inertia J as a function of swivel time t and swivel angle

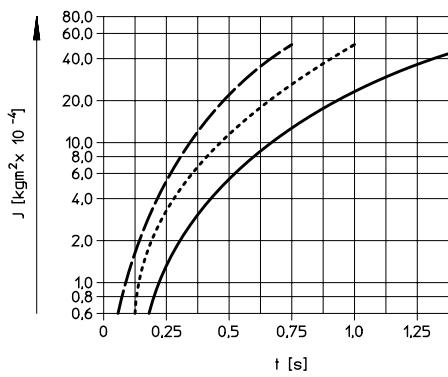

DSR/DSRL-10

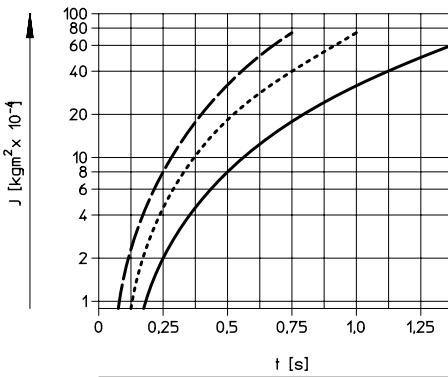

DSR/DSRL-12

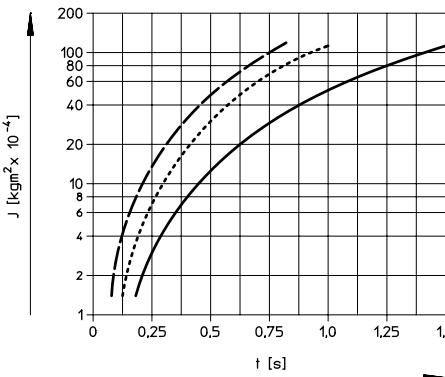

DSR/DSRL-16

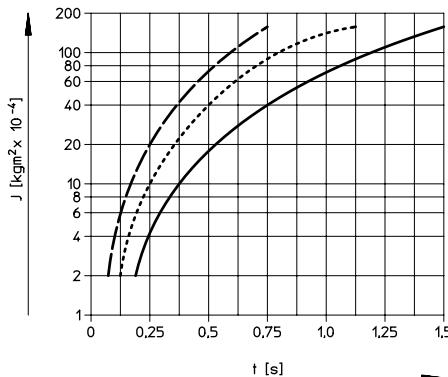

DSR/DSRL-25

DSR/DSRL-32

DSR/DSRL-40

- Swivel angle 90°
- - - Swivel angle 120°
- Swivel angle 180°

Assembly instructions:

If the specified max. mass moments of inertia are exceeded, external stops must be used. The following must therefore be observed:
A minimum radius must be maintained at all times between the stop and the drive shaft (r_{min}). The stop force must not exceed the maximum force. Because of the elastic stops, a precise end position can only be achieved using an external stop.

\varnothing [mm]	Stop radius r_{min} [mm]	Force [N]
10	13	60
12	15	90
16	17	160
25	21	320
32	28	480
40	40	650

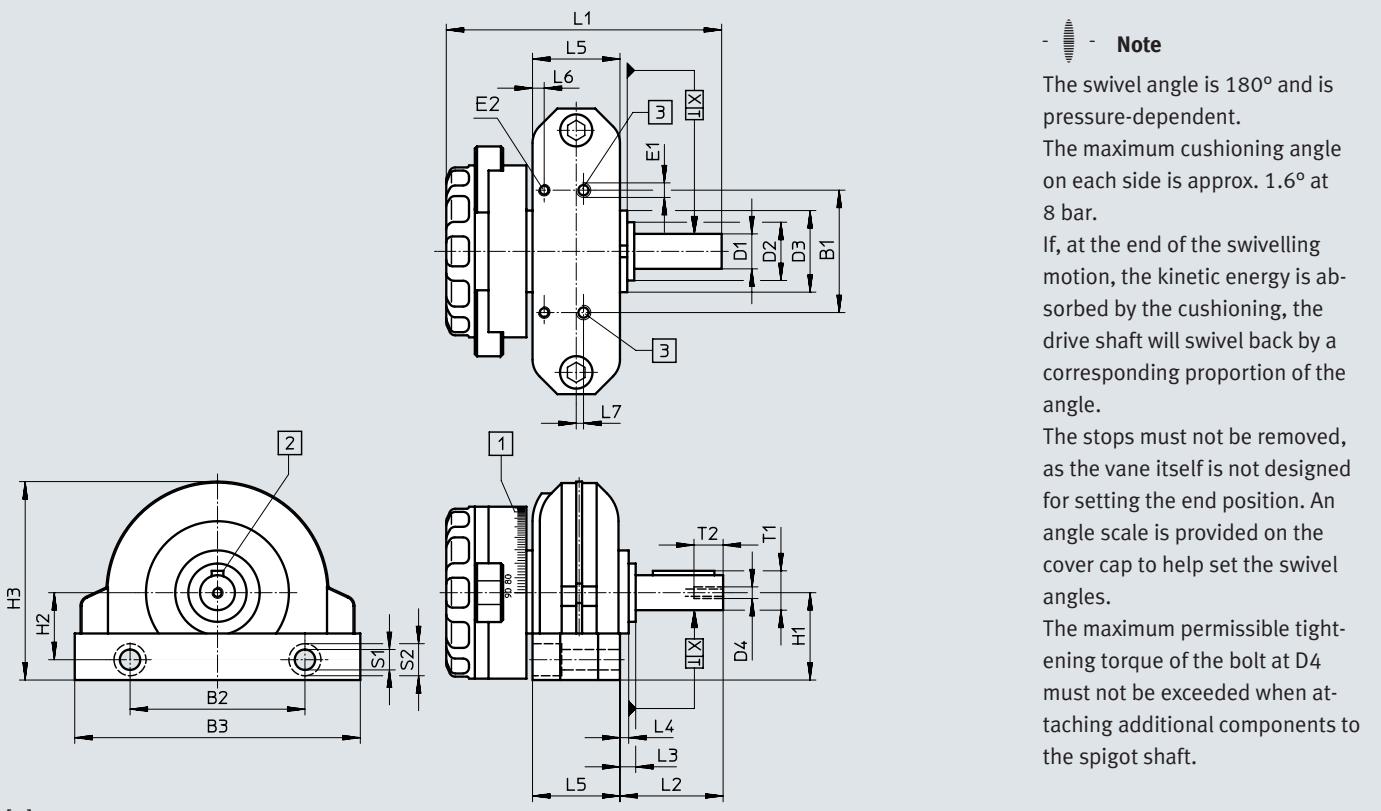

Note

If the semi-rotary drives are restricted to a swivel speed of less than 180°/s, the drives must be operated with a minimum of 6 bar. In this case, a variation of 30% from the constant speed must be taken into account. Flow control valves have to be used to reduce the variations from the constant speed and obtain the swivel times indicated in the graphs.

- [1] Angle scale for reading the swivel angle
- [2] Featherkey position at 0°
- [3] Compressed air supply port
- [4] Through-hole

Note

The swivel angle is 180° and is pressure-dependent.

The maximum cushioning angle on each side is approx. 1.6° at 8 bar.

If, at the end of the swivelling motion, the kinetic energy is absorbed by the cushioning, the drive shaft will swivel back by a corresponding proportion of the angle.

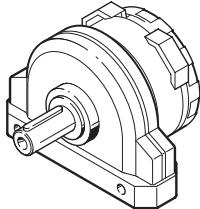

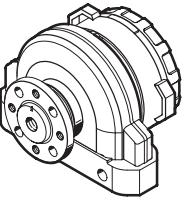

The stops must not be removed, as the vane itself is not designed for setting the end position. An angle scale is provided on the cover cap to help set the swivel angles.

The maximum permissible tightening torque of the bolt at D4 must not be exceeded when attaching additional components to the spigot shaft.
