

### Characteristics

Ordering data - modular system

Configurable product

This product and all its product options can be ordered online via the configurator.

Actuation			
Automatic	Manual		
The process valve is actuated using a pneumatic quarter turn actuator.	The process valve is actuated using a hand lever.		
EX certification			

II 2GD

ATEX category for gas II 2G

- Type of ignition protection for gas c T6 ... T3 X
- ATEX category for dust II 2D
- Type of ignition protection for dust c T80 °C ... T200 °C X
- Explosion-proof ambient temperature rating  $0^{\circ}C \le Ta \le +60^{\circ}C$

#### Application

#### Controlled

The required position of the process valve is specified via an analogue positioning signal, e.g. 4 ... 20 mA.

# Position indicator

The actual end position of the process valve unit can be transmitted either visually, directly on the process valve or via an electrical signal.

#### Limit switch box

Optical and electrical

#### Sensor principle, position indicator

This selection determines the measuring principle for the position indicator. Inductive sensors operate contactlessly. Magnetic reed and changeover switches operate with contacts.

#### Floating contact, changeover contact

Operating voltage range 0 ... 30 V DC Operating voltage range 0 ... 250 V AC Max. output current 3000 mA

#### Inductive

Max. output current 100 mA Operating voltage range 5 ... 60 V DC

Open/closed

Optical

The process valve is moved into both end positions.

Link *S* kvzb

# Characteristics

#### Magnetic reed

Operating voltage range 0 ... 175 V DC Max. output current 250 mA Operating voltage range 0 ... 120 V AC

#### Pilot valve

The pneumatic pilot valve is mounted directly on the quarter turn actuator via the NAMUR interface.

Standard version

A pneumatic pilot valve, with the design principle of a piston slide, is mounted directly on the quarter turn actuator via the NAMUR interface. The piston slide design is the first choice for all standard applications. The technology enables overlap-free switching and, compared to the poppet valve, has a greater flow rate with the same connection size. Poppet valve version

A pneumatic pilot valve, with the design principle of a poppet valve, is mounted directly on the quarter turn actuator via the NAMUR interface. The advantages of the poppet valve design come into their own when the demands on the application increase. They include greater tolerance against "dirty" compressed air, reduced leakages and fewer dynamic seals, which has an impact on service life.

#### Connection type

To DIN EN 1092-1 or ANSI B16.5 class 150

Clamp

To DIN 32676-B or ASME-BPE

Thread

Pipe thread to EN 10226-1 or ASME B1.20.1

Welded end

To EN 12627 or with extended welded ends to ISO 1127 or ASME-BPE

# Characteristics

### **Operating position**

1-2 connected, 3 closed, T-bore

1-3 connected, 2 closed, L-bore

2-3 connected, 1 closed, L-bore

Opened

#### Mode of operation

Double-acting

The double-acting quarter turn actuator requires compressed air for each direction of movement. In this mode of operation, the torque for opening or closing the process valve is generated purely via the compressed air. 1-2-3 connected, T-bore

1-3 connected, 2 closed, T-bore

2-3 connected, 1 closed, T-bore

Closed

#### Single-acting

With the single-acting quarter turn actuator, the incoming compressed air moves the pistons in one direction. This generates the torque of the actuator. The springs built into the actuator are pre-tensioned at the same time. This spring force generates the torque in the opposite direction of rotation when the pressure chambers of the actuator are exhausted. This causes the process valve to move to the required initial position.

#### Safety function

#### Return to normal position

The valve is moved to the selected normal position if the system fails. Note: The selection of the operating mode (double-acting or single-acting) has a decisive influence on when the safety function is carried out.

"Double-acting" operating mode: this function is carried out by a 5/2-way single solenoid pilot valve. The valve is only moved to the normal position if the operating voltage fails, but not if the compressed air supply fails.

• Single-acting" operating mode: this function is carried out by a 3/2-way single solenoid pilot valve. If the operating voltage or compressed air supply fails, the valve is moved to the normal position by the spring force of the actuator.

#### Hold position with 5/3C pilot valve

The valve is held in the current position if the operating voltage supply or compressed air fails. This function is only possible with the "double-acting" operating mode and is carried out by a 5/3-way pilot valve with closed intermediate position.

# Characteristics

#### Hold position with 5/2B pilot valve

The valve is held in the current position if the operating voltage supply fails. This function is only possible with the "double-acting" operation mode and is carried out by a 5/2-way double solenoid pilot valve which remains in the position last occupied before the fault occurred when pressure is applied to one side of the actuator. If the compressed air supply fails, the valve cannot be guaranteed to remain in the current position.

#### **Operating pressure**

The operating pressure available for actuating the quarter turn actuator.

#### Safety factor

The specification of a safety factor is recommended when configuring a quarter turn actuator because this increases the available torque reserve. Pipeline medium liquid 1.2

- Pipeline medium sticky/viscous 1.6
- Pipeline medium gaseous 1.5

These values are reference values and must be reviewed according to the application.

#### **Closing torque factor**

 $1 \rightarrow 2$  connection pressure

 $3 \rightarrow 4$  spring force

 $0^{\circ}$  = ball valve closed,  $90^{\circ}$  = ball valve open

Note: Specification of the closing torque factor is optional.

The torque required to operate the process valve is greatest at the start of the movement (breakaway torque). Under certain conditions, the closing torque of the process valve can be smaller than the breakaway torque. If this difference is known, it can be taken into account by specifying a closing torque factor.

For single-acting actuators, the correct sizing between the supply pressure  $(1 \rightarrow 2)$  and the spring force  $(3 \rightarrow 4)$  must be taken into account. When the ball valve opens, the actuator works against the spring and increases the spring force, while the supply pressure decreases at the same time. Point [1] in the diagram is the breakaway torque required to release the ball valve. Point [4] is the closing torque needed to return the ball valve to the closed position.

#### High corrosion resistance

#### Yes

Higher corrosion resistance thanks to epoxy coating of the pneumatic quarter turn actuator. The actuator shaft is stainless steel.
